To His Honour Henry Cockshutt,
Lieutenant-Governor of the Province of Ontario.

May It Please Your Honour:

The undersigned has the honour to present to Your Honour statements of the Auditor pursuant to the provisions of R.S.O., 1914, chap. 23, sec. 14, sub-sec. 2 of the Audit Act.

Respectfully submitted,

William H. Price,
Treasurer of Ontario.

Treasury Department, Ontario,
Toronto, February 9th, 1925.

AUDIT OFFICE,
TORONTO, FEBRUARY 9TH, 1925.

SIR,—I have the honour to submit for the information of the Legislative Assembly, pursuant to the provisions of an Order-in-Council, dated 28th October, 1909, as provided by R.S.O., 1914, chap. 23, sub-section 2 of section 32, and pursuant to the provisions of sub-section 2 of section 14, and sections 28 and 29 of the Audit Act:—

(A) Treasury Board Over-ruling.
(B) Statement of Special Warrants issued.
(C) Statement of expenditures in excess of appropriations.

Respectfully submitted,

G. A. BROWN,
Provincial Auditor.

HON. WILLIAM H. PRICE,
Treasurer of Ontario.

TREASURY BOARD OVER-RULING

A

TREASURY BOARD OVER-RULING

Re R. H. Greer Account for Services as Crown Counsel.

Department of Attorney-General,
Toronto, June 14th, 1924.

Memorandum for T. W. Gibson,
Deputy Minister of Mines.

I understood from Hon. Mr. McCrea that his Department would pay the difference between Greer's charge, viz., $125.00 and the $60.00 per diem which is the maximum amount usually allowed to barristers acting for the Crown.

E. Bayly,
Deputy Attorney-General.

Department of Mines.

Memorandum:

Hon. Mr. McCrea says that the difference in the per diem allowance may be paid by this Department out of Vote 213, Item 7, of the Supplementary Estimates.

Thos. W. Gibson,
Deputy Minister of Mines.

July 4th, 1924.

Provincial Auditor's Office,
Toronto, July 18th, 1924.

Memorandum for W. R. Rogers,
Acting Deputy Minister of Mines.

Having regard to Departmental Requisition No. 4961, R. H. Greer $325.00, for part payment of his account for legal services while acting for the Crown at the General Sessions of the Peace at Cochrane in the case of The King *vs.* Greenberg, *et al.*; may I respectfully point out that Mr. Greer's full account is properly chargeable to Administration of Justice in Districts, Vote 19, Item 14.

Mr. Greer rendered an account for $682.75 made up as follows:—

Five days at $125.00 per diem	$625 00
Disbursements	57 75
	$682 75

The Deputy Attorney-General wrote Mr. Gibson on June 14th last to the effect that $60.00 per diem is the maximum amount usually allowed to barristers acting for the Crown; but he approves of the charge of $125.00 per diem on the understanding that the Department of Mines pay the difference.

I submit that no part of Mr. Greer's account would appear to be payable by the Mines Department out of Vote 213, Item 9.

The case is purely a matter of Administration of Justice.

I am therefore returning Treasury Voucher No. 23562 in order that you may return the account to the Attorney-General's Department to which it belongs.

G. A. Brown,
Provincial Auditor.

Department of Mines.

Memorandum for G. A. Brown,
Provincial Auditor.

Referring to your memorandum of July 18th in reference to account of Mr. R. H. Greer, K.C., amounting to $325, who acted as Crown Prosecutor for this Department in June last, at Cochrane, I have forwarded to the Secretary of the Treasury Board an appeal from your ruling that the account is not properly payable by this Department.

The Minister was of the opinion that these cases were of sufficient importance to engage special counsel, and agreed to pay Mr. Greer the difference between his fee and the regular tariff allowed by the Department of the Attorney-General.

W. R. Rogers,
Acting Deputy Minister.

Toronto, Ontario, August 7th, 1924.

Department of Mines.

Memorandum for the Treasury Board re Account of R. H. Greer, K.C.

Under an arrangement between the Minister of Mines and the Attorney-General's Department, Mr. R. H. Greer, K.C., was employed to act as Crown Prosecutor at Cochrane in the "High-Grading" case of the Crown *vs.* Greenberg, *et al.*, details of which are as follows:

1. The arrangement was that Mr. Greer should receive $125 per day for his services, the Department of Mines to pay that part of the per diem allowance in excess of the regular tariff allowed by the Department of the Attorney-General, in other words, five days' services at $65, or a total of $325.

2. The Provincial Auditor states that the account is properly chargeable to the Administration of Justice, and that no part of Mr. Greer's account would properly be payable by the Mines Department out of Vote 13, Item 7, of the Supplementary Estimates for the fiscal year ending October 31st, 1924.

3. The matter was again referred to the Deputy Attorney-General, who stated that an appeal might be made to the Treasury Board under The Audit Act, section 14 (1) (*c*).

The undersigned respectfully recommends that under the circumstances cited, Mr. Greer be paid the sum of $325 by the Department of Mines out of Vote 213, Item 9, covering "Services, Salaries and Expenses not otherwise provided for," and that cheque do issue forthwith.

C. McCrea,
Minister of Mines.

August 8th, 1924.

Executive Council Office.

Copy of a Minute of the Treasury Board, dated the 12th day of August, A.D. 1924.

A difference having arisen between the Provincial Auditor and the Department of Mines, as to the payment of $325.00 to R. H. Greer, Esq., K.C., who acted as prosecutor for five days at Cochrane in the "High-Grading" case of the Crown *vs.* Greenberg, *et al.*, out of Vote 213, Item 9, covering "Services, Salaries and Expenses not otherwise provided for, Department of Mines," being in addition to the sum of $300.00 paid out of "Administration of Justice in Districts," Vote 19, Item 14, for the same services, an arrangement having been made between the Minister of Mines that the sum to be received per day by the said R. H. Greer, Esq., K.C., being $125.00, and the matter having been referred by the Minister of Mines for the determination of the Treasury Board under the provisions of Clause C, Sub-section 1, of section 14 of *The Audit Act*, Chapter 23, R.S.O. 1914.

Upon consideration of the correspondence and the facts set out in the memorandum by the Minister of Mines, the Board is of opinion that the Auditor's objections are insufficient and the Board hereby orders the issue of a cheque for the said sum of $325.00 to R. H. Greer, Esq., K.C., out of Vote 213, Item 9, Department of Mines.

Certified,
C. F. Bulmer,
Clerk, Treasury Board.

REPORT FOR 1924

OF

The Workmen's Compensation Board

ONTARIO

To His Honour the Lieutenant-Governor:

The Workmen's Compensation Board begs to submit its Report for the year 1924, being the tenth year of the operation of the Act.

GENERAL REVIEW

Benefits

The total amount of benefits awarded under the Act during the year 1924 was $6,122,820.34.

There has been little change in the amount during the past four years. The total in 1923 was $6,173,861.74, in 1922, $5,692,896.61, and in 1921, $6,189,263.49.

Of the total $6,122,820.34 benefits in 1924, $4,888,244.37 was in Schedule 1 industries, which are under the collective liability system, and $1,234,575.97 was in Schedule 2 (including Crown cases), which are under the individual liability system.

Of the $4,888,244.37 benefits in Schedule 1, $4,052,287.77 was compensation and $835,956.60 medical aid, the medical aid being 17 per cent. of the total. The amount of medical aid in 1923, 1922, and 1921, respectively, was $788,905.90, $692,819.94, and $662,793.89. The Schedule 2 figures do not include medical aid, it being provided and paid for directly by the employer.

Accidents

There were 58,675 accidents in all reported to the Board in 1924, as compared with 61,109 in 1923, 50,411 in 1922, and 45,191 in 1921. The number of fatal cases was 402.

Less than 1 per cent. of all cases under the Act result in death, nearly 5 per cent. have some degree of permanent disability, about 54 per cent. cause temporary disability of seven days or more, and the remaining 40 per cent. involve medical aid only.

More small accidents are being reported now than formerly. Cases for medical aid only show a large increase and temporary disability cases a slight increase, while permanent disability and death cases have slightly decreased. The workmen's average time loss for each accident has not materially altered.

Nearly half the benefits paid are for cases with some permanent disability, considerably more than one quarter for temporary disability cases, and considerably less than one quarter for death cases. The cost of permanent disability cases ranges from $150 or less for loss of part of a finger to a maximum of $25,000 for total disability; death cases where there are dependants cost an average of about $5,000 and a maximum of $13,000; temporary disability accidents average about $70, the majority of them causing no more than a few weeks' loss of time.

Less than one quarter of all the accidents now are caused by machinery. A far greater number result from handling, striking against, or being struck by, objects or material. The great reduction in machinery accidents may be

attributed to more systematic attention by employers to the work of accident prevention.

Workmen

About 87 per cent. of the injured workmen are British subjects, 57 per cent. are married, and less than 2 per cent. are females. Their average age is 34.

Their average wage in 1923 was $23.32, as compared with $22.15 in 1922, $25 in 1921, $25.50 in 1920, and $13.25 in 1915.

Condition of Industries

The total pay roll during 1924 for the industries in Schedule 1 is estimated at $387,085,000, as compared with $434,163,000 in 1923, $391,888,000 in 1922, $355,259,000 in 1921, and $464,589,000 in 1920, showing a much smaller decrease than might have been expected. In 1915 the total pay roll was $147,603,000.

The number of employers in Schedule 1 is 25,155. The industries with the largest pay roll are building, lumbering, and mining, and those having the largest accident cost are lumbering, mining, and building, in the order named. The parts of the province having the greatest number of accidents are the County of York, the District of Temiskaming, and the Counties of Wentworth, Welland, and Essex, in the order named. No figures are available for the amount of pay roll in Schedule 2 but it is estimated at about one-third of Schedule 1, making the total pay roll of all industries under the Act $516,113,000. The chief employments not covered are mercantile business, farming, and domestic service.

Assessments

The assessments paid by employers in Schedule 1 vary according to the accident cost in each class of industry, being for instance $5 per $100 of pay roll for quarrying, which has had a very bad accident experience, and five cents per $100 of pay roll in clothing manufacturing, which has a very light accident hazard. The average over all for 1924 was $1.17, and the average since the commencement of the Act $1.10.

The administration expenses of the Act are about 4 per cent. of the total benefits.

Work Handled

Each day during 1924 an average of 195 new accidents were dealt with, $20,400 was awarded in compensation and medical aid, and 614 cheques were issued; assessments averaged 100 per day; about 4,000 pieces of mail were received and despatched each day, and the average number of office callers was 80.

The average time elapsing between receipt of the necessary reports and forwarding of the first compensation cheque was less than two days.

Ten Years' Operation of Act

The close of the first ten years' operation of the present Act invites retrospection.

The Act was passed in 1914 under the premiership of the late Sir James Whitney, coming into effect 1st January, 1915, having been framed by the late Chief Justice Sir William Meredith after prolonged investigation and consideration, with the help of representatives of both workmen and employers. It was the first Act of its kind in Canada, and a radical departure from the old law. It was received by workmen in general with favor, by employers with much misgiving and some antagonism.

Dealing with questions between Capital and Labor and directly touching the pockets of an immense number of people, fixing what some are to receive and others are to pay, as well as the usual difficulties and dangers that beset all public administration, made the handling of the work a matter of some anxiety with the framer and great doubt with some of those concerned; and the Act has had to pass through the unsettled and trying times of the war and the war's aftermath.

Over 440,000 accidents have been dealt with, nearly $46,000,000 awarded to injured workmen and their dependants in compensation and medical aid, and about 225,000 assessments levied from employers.

Both workmen and employers are in general so far satisfied with the working of the Act that they have protested against the making of any material change in the administration.

There can be no doubt the law has proved exceedingly beneficial to both parties. Workmen appreciate the wide protection and liberal scale of compensation which they receive, and the speediness and certainty of payment which they enjoy under the simple form of procedure and the collective system of liability which prevail; employers appreciate their freedom from individual liability, which might cripple or ruin any but the largest, and the saving which is entailed by getting insurance at cost; both parties appreciate the immunity from the annoyances and the enormous expense of litigation.

Though compensation is a matter of right and not a matter of charity, the Act brings relief and assistance to many thousands of injured workmen and widows and children throughout the province who would otherwise be in need. Nearly 800,000 compensation and over 350,000 medical aid cheques have been issued during the ten years, the accidents averaging nearly one accident for each of the 450,000 workmen covered by the Act.

With the larger allowances to widows and children, the increased percentage and the high maximum and minimum, and full medical aid, the Ontario Act is probably now the most liberal of any upon the continent. But it is very far from being the most burdensome upon the employer. Comparison of the Ontario rate book with the rate manuals of neighboring states will show that our rates of assessment are exceedingly low for the amount of benefits paid, the expenses being very light and there being no cost of procuring business, or profit or other loading, as in ordinary insurance. The collection in Pennsylvania of over $80,000,000 premiums to pay $35,000,000 benefits, and in Britain of over £8,000,000 premiums to pay about £3,000,000 benefits, while Ontario collects only $100 to pay $96 benefits, are illustrations of the reason for our low rates. Perhaps nowhere else does so nearly the whole of what the employers pay actually reach the hands of the injured workmen or their dependants.

With its immense advantages it may be asked why our system of administration is not more widespread. It is because of doubt as to keeping things on the merits and avoiding indirect influences and exploitation. There have been many examples of late of the falling down of public administration and many warnings of the necessity of conscientiousness at all cost in the performance of public duty; and the need is greater in the decision of cases than in the ordinary work of administration. New York is now trying to get rid of political constraint in the decisions of its Commission; Quebec is afraid to adopt our form of administration for fear of weaknesses and similar abuses. If such an administration is to be a success there must not only be efficiency but also the strictest integrity and neither fear nor favor in the handling of the work.

CHAPTER I

SCHEDULE 1 INDUSTRIES FOR 1924

Two Systems

As some of the industries covered by the Act are under the collective liability system (the employer not being individually liable for accidents to his workmen but being assessed to provide a general fund out of which accidents occurring in his class of industry throughout the province are taken care of) and others are under the individual liability system (the employer being liable to pay for accidents happening to his own workmen) separate financial statements have to be made for each. The industries under the collective liability system are included in Schedule 1, and those under individual liability in Schedule 2, the former comprising much the greater number.

This chapter deals with Schedule 1 industries for 1924. Schedule 2 industries are dealt with in Chapter II, while Chapter III deals with the work handled in both schedules and the administration of the Act generally during the year, Chapter IV with the different funds in both schedules and their standing at the end of 1924, and Chapter V gives financial and statistical information for 1923 which was not available when the report for that year was made.

Provisional Financial Statement

The provisional financial statement for the industries in Schedule 1 for 1924 is contained in Table 1. To show the standing for the year estimates have to be made of adjustments of assessments according to actual pay rolls and on the retroactive rates (the assessments for the year being first levied on an estimate of pay roll and at a provisional rate), and estimates also have to be made of compensation and medical aid still to be awarded for accidents happening during the year which have not yet been finally disposed of by reason of the injured workman being still under medical treatment or reports not being received. Final figures for the year 1924 will be shown in the next subsequent report in the same manner as the final figures for 1923 are shown in Table 15 of this report.

The difference is to be noted between the amount of compensation and medical aid awarded for the year's accidents and the amount awarded during the year. The latter is partly for the prior year's accidents, while upon the other hand it does not cover all the liability for the current year's accidents. The more correct system of charging each year as far as possible with its own accidents, and for that purpose keeping the year's accounts open till the end of the subsequent year, has been adopted, rather than the looser method of taking the amount awarded during the year as the cost of the year's accidents and leaving always an outstanding liability unprovided for. For the purpose of information and comparison, however, the amounts awarded during the year are shown in Chapter III.

Accounts for Each Class

The industries in Schedule 1 are divided into classes, and as each class (subject to any transfer that may be made to it from the Disaster Reserve in any case of undue burden) bears its own accident cost—the employers in the class being in effect a mutual insurance association—separate accounts have to be kept for the different classes. Each class is credited with its own assess-

ments, its share of interest and other income, and with any transfer made to it from Disaster Reserve, or credit from any other source, and is charged with the cost of its own accidents, its share of administration expenses, the cost of its safety association if it has one, and with its share of any amount set aside for Disaster Reserve.

The figures for each class, and the provisional surplus or deficit for the year, and the balance forward from prior years, and the provisional surplus or deficit for all years, are shown in Table 1. The final figures for each class and also the figures for the different groups within the classes (as in Table 15) will be shown in the next report. The assessments are fixed according to the accident cost and other expenses and charges in each class and group and having regard to the other income and credits.

In former reports the terms "income" and "expenditure" were used, but as transfers to or from Disaster Reserve and the transfer at the beginning of 1924 of the surplus in the Pension Fund are not strictly speaking income and expenditure, the terms "credits" and "charges" are now added.

The classes are numbered and the nature of the industries in each is shown at the bottom of Table 1, and full enumeration of the industries will be found in Schedule 1 of the Act and in the Board's rate book, the latter also showing the grouping within the class.

Assessments and Other Credits

The total assessments in all the classes in Schedule 1 for the year, including estimated adjustments, amounted to $4,515,708.50. In assessments are included collections for default in making returns or payments, and balances for under and over estimate and merit rating. The other income and credits for the year consisted of $152,339.94 interest (this being exclusive of the interest credited to Pension Fund, Disaster Reserve and Compensation Deferred, as shown in Chapter IV); $23,600.85 received from the Department of Soldiers' Civil Re-establishment, reimbursement for veteran cases; $7,887.78 cost of accidents collected under Section 93*a* from employers failing to furnish pay roll prior to accident; $1,224.20 from third parties under Section 9; $139.09 from employers under Section 99 (3) for failure to furnish particulars of accident; and there was also at the beginning of the year a re-transfer of $600,000 from the Pension Fund as a result of actuarial revaluation of pension liability, as explained in Chapter IV. The total income and credits amounted to $5,300,900.36.

Compensation and Other Charges

The compensation in Schedule 1 industries for the year, including estimate of what is still to be awarded for accidents happening during the year, amounted to $3,960,068.95; the medical aid, including estimate for what is outstanding, amounted to $731,613.11; the administration expenses for Schedule 1 amounted to $209,962.27; and $79,506.14 was paid to the employers' safety associations. The total expenditure and charges for the year were $4,981,150.47.

Deducting the provisional amount of expenditure and charges from the provisional amount of income and credits leaves a provisional surplus for the year of $319,749.89. The balance forward from prior years was a deficit of $327,427.92, and deducting from this the surplus of $319,749.89 for the year 1924 leaves a net provisional deficit of $7,678.03 at December 31, 1924.

Financial statement for Schedule 1 industries since the commencement of the Act is contained in the Appendix.

Number of Employers

The total number of employers listed in Schedule 1 at the end of 1924 was 25,155, as compared with 22,201 at the end of 1923. The number in each class and group of industry is shown in Table 2.

Wage Expenditure

The estimated total wage expenditure in Schedule 1 industries for the year 1924, calculated on provisional figures, is $387,085,000, as compared with $434,163,000 in 1923. The amounts for the different classes of industry are shown in Table 3.

The Board has no similar data for Schedule 2 and Crown industries as in these the employers pay for the accidents to their own workmen and are not required to make pay roll returns or pay assessments upon them as in Schedule 1. The pay roll would probably be about one-third that of Schedule 1.

Average Rates of Assessment

Assessments in Schedule 1 are in the form of a percentage of pay roll and the average rate or percentage over all the classes actually paid by the employers can be ascertained by relating the total assessments to the total wage expenditure. This, on the provisional figures, gives an average rate of assessment for 1924 of $1.17 on every $100 of pay roll. The average over all years since the commencement of the Act was $1.10.

PROVISIONAL FINANCIAL STATEMENT FOR SCHEDULE 1, BY CLASSES, FOR 1924

CHAPTER II

SCHEDULE 2 INDUSTRIES DURING 1924

A statement of the compensation awarded and the moneys handled during 1924 in Schedule 2 industries (in which the employer is individually liable for accidents to his workmen) is given in Table 4. Dominion Crown Cases under the Act by Dominion legislation, and Provincial Crown Cases referred to the Board for adjustment, are included.

The total amount of compensation awarded in Schedule 2 industries and Crown cases during 1924 was $1,234,575.97. Of this, $187,251.33 was for workmen of municipal corporations, $361,663.57 for steam railways, $22,709.26 for electric railways, $42,011.06 for navigation companies, $18,597.59 for telephone and telegraph companies, $544,462.31 for Dominion Crown cases and $51,236.50 for Provincial Crown cases.

In pension cases, except in the case of municipal or government bodies or departments thereof, not so desiring, deposits must be made by employers in Schedule 2 industries. Particulars of these are given under "Deposits under Section 28". Under "Claimants' Moneys" are included moneys held by the Board under awards in which in the interest of the claimant, or for some other reason, payment of the amounts held is deferred to a later date, as in the case of minors. "Deposits under Section 31a" are amounts deposited with the Board to enable the Board to make prompt payments without waiting for receipt of cheque from employer.

Employers in Schedule 2 are assessed their share of the expense of administration, as set out in Table 9. For 1924 that share amounted to $22,745.14, as compared with $27,583.24 in 1923, and $20,051.20 in 1922. Proportionate to the amount of compensation awarded, administration expenses in Schedule 2 and Crown cases were 3.64 per cent. in 1924, as compared with 3.10 per cent. in 1923.

Further information as to Schedule 2 funds, and particulars of Schedule 2 investments, are given in Chapter IV and in Tables 10 and 14, and in the Appendix.

CHAPTER III

WORK HANDLED DURING 1924

This chapter deals with the work handled during 1924 and wi
trat ion of the Act generally during the year. Particulars are g
5 to 9.

The figures are for what has been dealt with during 1924 without
the year in which the accidents dealt with occurred, while as explained
Chapter I the figures in Chapter I and Chapter V are for the accidents happening during the year.

Benefits Awarded During the Year

The total amount of compensation awarded during 1924 was $5,286,863.74, of which $4,052,287.77 was in Schedule 1 industries and $1,234,575.97 in Schedule 2 and Crown cases; there was also paid for medical aid in Schedule 1 during the year $835,956.60, making the total benefits awarded during the
820.34. In Schedule 2 and Crown cases medical aid is provided
employer and no figures are available.

The benefits awarded during each year since the commencement of the Act are as follows:

Year	Schedule 1 Compensation	Schedule 1 Medical Aid	Schedule 2 and Crown Compensation	Total Benefits
1924	$4,052,287 77	$835,956 60	$1,234,575 97	$6,122,820
1923	4,036,170 26	788,905 90	1,348,785 58	6,173,861
1922	3,417,101 61	692,819 94	1,582,975 06	5,692,896
1921	3,858,017 50	662,793 89	1,668,452 10	6,189,263
1920	5,113,149 77	703,705 66	1,963,389 82	7,780,245
1919	2,808,638 65	386,298 51	997,922 77	4,192,859
1918	2,751,137 45	369,346 37	763,511 02	3,883,99
1917	2,286,954 99	*83,514 07	623,556 37	2,994,02
1916	1,553,653 38	†.....	451,709 93	2,005,363
1915	692,389 09	†.....	200,932 03	893,321 12
Totals	$30,569,500 47	$4,523,340 94	$10,835,810 65	$45,928,652 06

*Half-year only. †No provision for medical aid.

The increase in benefits from the early years is largely by reason of incre
in wages, compensation being for the most part a percentage of wages, additional industries have been covered, and some material increases were n
in compensation. The large total for 1920 is by reason of the retroactive inc
in widows' and children's pensions and the small amount awarded during
is by reason of many 1915 accidents not being, nor capable of being, f
disposed of till the following year. The amount of benefits awarded for
year's accidents as distinguished from the amount awarded during the year is shown in Chapter V.

Accidents Reported During the Year

During 1924, 58,675 accidents were reported. These included some not serious enough to involve payment of either compensation or medical aid and for which no claim was made.

At the close of the year there were 1,330 claims in assembly, as compared with 1,837 at the end of 1923, notice of the accident having been given but reports necessary to deal with the case not yet having been received.

umber of accidents reported each year and the total number since ncement of the Act are as follows:

	Schedule 1	Schedule 2	Crown	Totals
Cash in bank an				
Deposits receivec	49,558	4,916	4,201	58,675

Accidents Paid For During the Year

Table 5 shows the number of accidents in which compensation or medical aid was paid during 1924. The total number was 51,911, as compared with 53,638 [illegible]23. The 51,911 comprised 353 death cases, 31 permanent total disability cases, 2,314 permanent partial disability cases, 27,914 temporary disability cases, and 21,299 cases in which medical aid only was paid. Schedule 2 and Crown cases involving medical aid only, which are a large proportion of the accidents reported, are not included as accidents paid for as the medical aid is furnished directly by the employer.

Of the 51,911 accidents in which some compensation or medical aid was paid during 1924, 7,020 occurred in 1923 and 44,891 in 1924.

The number of accidents in which compensation or medical aid was awarded each year since the commencement of the Act is as follows:

Year	Schedule 1	Schedule 2	Crown	Totals
1924	46,616	2,820	2,475	51,911
1923	47,873	3,849	1,916	53,638
1922	37,172	4,572	765	42,509
1921	34,271	5,161	834	40,266
1920	42,693	4,444	714	47,851
1919	34,400	4,517	153	39,070
1918	36,565	4,335	30	40,930
*1917	25,277	3,406	19	28,702
*1916	15,370	2,825	3	18,208
*1915	8,328	1,494	7	9,829

*Cases involving medical aid only not covered till July 1, 1917.

Awards Changed

In addition to claims compensated, as shown in Table 5, the Board in 1924 reopened for further action 252 claims which had been previously settled. Of these, 4 were cases which had subsequently terminated in death, 4 were cases of foreign-born pensioners returning to their native land, commutation being made of their pension, and 244 were cases of other awards previously made being changed in form or amount.

Cheques, Assessments, Mail, and Callers

In all 186,704 cheques were issued during the year, an average of 614 daily, and there were 27,082 ordinary assessments and 3,168 merit rating assessments, including refunds, made. About 4,000 pieces of mail daily were handled, and the average number of office callers per day was 80.

Receipts and Payments

The receipts and payments during the year are shown in Table 6, the statement for Schedule 2 including Crown cases. Explanation of the items and the funds referred to will be found in other parts of the report. A summary of receipts and payments since the commencement of the Act is given in the Appendix.

Payments to Safety Associations

The safety or accident prevention associations are organizations of employers established under the authority of the Act by the employers in 18 out of the 24 classes of industry. They are under the management of the employers but the expenses are paid by the Board out of the accident fund.

Table 7 gives the names of these associations, the classes of industry covered, the names and salaries of their inspectors, the amounts paid for travelling expenses and granted for other expenses, during 1924. The total expenses for the year were $79,506.14. The total cost of these associations since the commencement of the Act was $506,951.50.

Administration Expenses

The administration expenses of the Board, analyzed under the different headings, are shown in Table 8. The total administration expenses during 1924 were $254,846.93, as compared with $237,433.34 in 1923. The employers now pay the whole of this expense, the amount being divided, according to the accidents handled, between Schedule 1, Schedule 2, and Dominion and Provincial Crown. The amount charged to Schedule 1 employers for the year was $209,962.27, to Schedule 2, $22,745.14, to Dominion Crown, $20,478.79, and to Provincial Crown, $1,660.73.

The total amount of administration expenses since the commencement of the Act was $1,838,842.39, of which $965,625.19 was charged to Schedule 1, $220,941.92 to Schedule 2 and Crown, and $652,275.28 was contributed by the Province in addition to the $3,224.72 charged the Province for handling its cases during 1920, 1921, and 1922. These figures do not include value of use of office premises provided by the Province during the first six years, nor do they include the salaries of the Members of the Board which have always been paid by the Province.

The cost of office furniture, fixtures and equipment, including permanent equipment, has always been charged to administration expenses. The value of this at the present time is estimated at about $20,000. This has not been entered in the statement of the standing of the funds.

The total administration expenses for 1924 were 4.16 per cent. of the total benefits awarded. The average percentage since the commencement of the Act was 3.95. When the Province was contributing to administration expenses the percentage actually paid by employers was much lower, averaging about 2 per cent. The administration expenses in Schedule 1 for 1924 were 4.30 per cent. of the benefits awarded during the year, those in Schedule 2 and Crown being 3.64 per cent.

The names, positions, and salaries of the staff of the Board are given in Table 9.

CHAPTER IV

CONDITION OF FUNDS

A general statement of the condition of the funds in Schedule 1 and in Schedule 2 is contained in Table 10, and particulars of the various funds and of the Board's investments are given in Tables 11 to 14. A summary since the commencement of the Act will be found in the Appendix.

Schedule 1 Funds

The Schedule 1 funds are known and referred to in the Act as the "Accident Fund". They comprise, in addition to current funds out of which temporary payments of compensation, medical aid, and administration expenses are paid, the Pension Fund, Disaster Reserve, and Compensation Deferred. The standing of the Accident Fund, showing assets and liabilities, at December 31, 1924, is shown in Table 10. The balance of assets in excess of liabilities at that date was $383,703.78. This is exclusive of office furniture and equipment mentioned in Chapter III.

Pension Fund

The Pension Fund, representing the outstanding pension liability, comprises the largest part of the funds standing to the credit of Schedule 1. The purpose of the Pension Fund is to take care of future payments of pensions which have already been awarded. Actuarial tables (published as an appendix to the Report for 1922), embodying the contingencies of death and remarriage, have been compiled to show for each age and kind of pension the average amount (sometimes referred to as capitalized value) necessary to complete pension payments. When a pension is awarded this average amount is transferred from current funds to the Pension Fund. All payments of pensions are made from the Pension Fund. Since the amount transferred in any one instance is the average amount required, no re-transfer is made should a residue be left at the expiry of the pension, nor is any additional transfer made should the amount be exhausted before expiry of the pension.

Re-transfer from Pension Fund

During the years 1923 and 1924 an actuarial survey of the Board's pension experience and revaluation of the pension liability was made, all existing pensions being revalued. As a result the Pension Fund was found to be a little in excess of what the experience indicated to be necessary. A re-transfer of $600,000 was accordingly made from the Pension Fund to current funds, being distributed among the different classes of industry in proportion to the amount of Pension Fund to the credit of each class.

Particulars of Pension Fund

Table 11 gives particulars of the Pension Fund for each class. The balance in the fund at the commencement of 1924 was $11,517,463.91; $600,000 was re-transferred to current funds as mentioned in the last paragraph; $1,928,921.75 was transferred during the year for pension awards; $599,105.53 interest (at the rate of 5 per cent. compounded half yearly, being the basis used in computing capitalized values of pensions) was added; and $1,012,204.56 was paid for pensions. The balance in the fund at the end of the year was $12,433,286.63.

Disaster Reserve

The Disaster Reserve is a fund set aside under the provisions of Section 88 (2) of the Act to meet any unforeseen disaster or other circumstance which might unduly burden the employers in any class of industry. The fund was accumulated by a transfer of one per cent. of the gross assessments up to the end of 1922, since that time no transfer being made, the fund being considered sufficient for its purpose. These are the only moneys set aside or held by the Board which do not directly cover liabilities actually incurred by reason of accidents which have already happened.

The standing of the Disaster Reserve is shown in Table 12. The balance at the end of 1924 was $251,763.06, $13,936.63 interest for the year being added to the balance of $237,826.43 in the fund at the beginning of the year.

Compensation Deferred

The funds included under "Compensation Deferred" comprise compensation moneys held at interest for claimants in Schedule 1, payment being deferred to a future time by reason of the claimant being a minor or for other reason. The condition of the fund is shown in Table 13. At the beginning of the year the amount in the fund was $159,863.14; deferred awards during the year amounted to $40,770, and $7,250.44 interest was added for the year; the payments out of the fund during the year amounted to $66,674.82, of which $57,278.02 was for principal and $9,396.80 for interest, leaving a balance of $141,208.76 in the fund at the end of the year.

Investments

Particulars of the Board's investments are given in Table 14.

The $13,642,517.75 invested at the end of the year in Schedule 1 was made up of $12,433,286.63 Pension Fund, $251,763.06 Disaster Reserve, $141,208.76 Compensation Deferred, $139,618.75 accrued interest (earned but not received), and includes also current funds to the amount of $676,640.55, there being always an outstanding unascertained liability for accidents not yet reported or not yet finally disposed of.

Particulars of each investment are shown in the list, including kind of investment, particular security, yield of interest, term, par value, book value, and accrued interest.

With the exception of short-date deposits of current funds intended for use before the current year's assessments are received, all investments consist of municipal or municipally-guaranteed debentures and Dominion of Canada War Loans.

The average rate of interest received on permanent investments in Schedule 1 during 1924 was approximately 5.86 per cent., as compared with 5.93 per cent. received during 1923, and 5.75 per cent. received during 1922. Three per cent. is received on current bank balances.

Schedule 2 Funds

The funds handled by the Board in respect of Schedule 2 industries include employers' deposits for pensions required to be made with the Board under the provisions of Section 28 of the Act, temporary deposits or advances of money made by employers under Section 31a to facilitate prompt payment of claims, and claimants' moneys held by the Board in cases of awards payment of which by reason of the claimant being a minor or for other reason is deferred to a future time.

The standing of Schedule 2 Funds at December 31, 1924, is shown in the latter part of Table 10, and the particulars and a list of Schedule 2 investments are given in Table 14.

At the end of 1924 the deposits held under Section 28 amounted to $3,358,012.21, deposits under Section 31a to $51,376.99, the amount of claimants' moneys held by the Board was $57,627.17, and the accruedi nterest on investments, not received or apportioned, amounted to $33,577.31, making a total of $3,500,593.68, of which $3,359,443.00 was held in permanent investments, $107,573.37 was on deposit in the Imperial Bank, and $33,577.31 was interest accrued on investments but not yet payable.

The rate of interest received on Schedule 2 Funds during 1924 was 5.98 per cent., as compared with 6.02 per cent. during 1923, and 6.04 per cent. during 1922.

CHAPTER V

1923 OPERATIONS

This chapter deals with the year 1923, containing information which was not available when the report for that year was made.

It gives the final financial statement for Schedule 1 industries for the year, estimates of the adjustment of assessments and of the outstanding compensation and medical aid having to be used in the provisional statement given in Table 1 of the 1923 report; and it gives statistical information as to the accidents which happened during 1923, their causes, the nature of the injuries suffered, the number, time loss, total and average cost of the different classes of cases, and the age, wage, nationality, and marital condition of the injured workmen.

This information is contained in Tables 15 to 27.

Financial Statement Schedule 1, 1923

Table 15 gives the final financial statement for Schedule 1 industries for 1923, provisional figures for which were given in Table 1 of the 1923 report. It shows the income and credits and the expenditure and charges, and the balance, for each class of industry; also the actual assessments and accident cost and other items of income and expenditure for each class, and the assessments and accident cost for each group of industry within the class. The list of industries included in each class and group will be found in the Board's rate book, the list of industries in the different classes is also printed with the Act, and their general nature is indicated at the bottom of Table 1 of this report.

The net income and credits for all the classes for the year were $4,015,240.63, the net expenditure and charges, $5,254,960.82, leaving a deficit for the year of $1,239,720.19. Deducting the balance forward from prior years of $912,292.27 leaves a net actual deficit at the end of the year 1923 of $327,427.92, as compared with a provisional or estimated deficit of $559,550.22.

Assessments and Accident Cost

The assessments and accident cost (the latter comprising compensation and medical aid) in Schedule 1 for each year since the commencement of the Act, and the totals to the end of 1923, are as follows:

Year	Assessments	Accident Cost
1915	$1,831,537 52	$1,091,020 43
1916	2,361,463 20	1,880,004 37
1917	2,662,383 29	2,639,560 56
1918	3,303,575 83	3,214,427 57
1919	3,840,949 07	4,474,847 38
1920	5,579,333 45	5,041,947 30
1921	4,594,452 37	4,277,034 67
1922	3,984,594 64	4,323,801 07
1923	3,771,321 09	4,977,331 82
Totals	$31,929,610 46	$31,919,975 17

Pay Roll and Rates of Assessment

As assessments are in the form of a percentage of pay roll the average rate paid by employers in Schedule 1 can be determined by dividing the total assess-

ments for the year by the total pay roll. The following table shows the total amount of pay roll and the total assessments and the average rate per $100 for each year:

Year	Total Pay Roll	Total Assessments	Average Rate per $100
1915	$147,603,000	$1,831,537 52	$1 24
1916	220,840,000	2,361,463 20	1 07
1917	286,903,000	2,662,383 29	93
1918	310,450,000	3,303,575 83	1 06
1919	325,226,000	3,840,949 07	1 18
1920	464,589,000	5,579,333 45	1 20
1921	355,259,000	4,594,452 37	1 29
1922	391,888,000	3,984,594 64	1 02
1923	434,163,000	3,771,321 09	87

These rates are slightly lower than those appearing in prior reports, interest and other income and credits as well as assessments having been included in previous calculations. The very low rate for 1923 was by reason of the reduction of surplus and the contemplated re-transfer of an amount from the Pension Fund as explained in Chapter IV.

Final Accident Figures, 1923

Table 16 shows the number of accidents happening in 1923 (in all industries under the Act) for which payment of compensation or medical aid was made. The total number was 51,746, of which 327 were death cases, 2,340 cases involving some degree of permanent disability, 28,954 temporary disability cases, and 20,125 cases which involved medical aid only. Schedule two cases involving medical aid only are not included as in these cases medical aid is furnished directly by the employer.

The complete figures for each year since the commencement of the Act are as follows:

Year	Medical Aid Only	Temporary Disability	Permanent Disability	Death	Totals
1915	*	9,311	1,339	296	10,946
1916	*	15,993	2,232	373	18,598
1917	†4,267	21,556	2,475	370	28,668
1918	12,822	24,089	2,624	366	39,901
1919	11,769	22,418	2,457	364	37,008
1920	15,566	27,423	2,735	373	46,097
1921	12,141	22,855	2,079	331	37,406
1922	15,913	24,461	2,082	325	42,781
1923	20,125	28,954	2,340	327	51,746
Totals	92,603	197,060	20,363	3,125	313,151

*No medical aid. †Half year only.

Accident Frequencies, Schedule 1

Comparison of accident frequencies can be made by correlating the number of accidents with the total number of full-year workers, data for this being available, however, only in Schedule 1. Eliminating accidents in which medical aid only was paid, the number of accidents for each 100 full-year workers for the different years are:

Year	Temporary Disability	Permanent Disability	Death	Totals
1915	3.63	.58	.12	4.32
1916	4.99	.79	.10	5.88
1917	5.78	.72	.07	6.57
1918	5.81	.66	.07	6.54
1919	5.81	.68	.07	6.56
1920	6.23	.67	.07	6.97
1921	6.25	.60	.05	6.90
1922	5.82	.52	.06	6.40
1923	6.02	.51	.05	6.58

On the same basis of calculation the frequency of medical aid only cases has been: 1918, 3.66; 1919, 3.70; 1920, 4.26; 1921, 4.24; 1922, 4.67; and 1923, 4.96.

Statistical Distributions

Tables 17 to 27 give statistical details regarding accidents and workmen, including, where the data is available, Schedule 2 and Crown cases as well as Schedule 1. Considerations of space preclude more extensive tabulations but the original material is retained and still fuller information is always available concerning the accidents in any of the different classes of industry.

Month of Occurrence

Table 17 gives the month of occurrence of all accidents. The month in which the greatest number occurred during 1923 was August, with 5,103, and the month with the lowest number was February, with 3,411.

Accidents According to Locality

The distribution of accidents according to county or district in which they occurred is contained in Table 18. York had the highest number, 11,123, and next in order were Temiskaming with 4,375, Wentworth with 4,174, Welland with 2,949, and Essex with 2,607.

Time Loss, Age, and Wage

Table 19 shows the average age and wage of workmen receiving compensation, and the total and average time loss for each class of industry and for each category of disability. The average age for 1923 was 34.24 years. The average weekly wage for 1923 was $23.32, as compared with $22.15 for 1922, and $25.07 for 1921. The total time loss in temporary disability cases was 570,735 days, or an average of 19.71 days, as compared with an average of 20.01 in 1922, and 20.94 in 1921.

Compensation and Medical Aid Costs, Schedule 1

In Table 20 is given the total and average cost of compensation and medical aid by classes in Schedule 1 for each kind of disability.

The total cost of all accidents was $4,977,331.82, of which $4,159,890.24 was for compensation and $817,441.58 was for medical aid.

Of the $4,159,890.24 compensation cost, $1,225,863.60 was for temporary disability cases, $2,118,897.76 was for permanent disability cases, and $815,-128.88 was for death cases.

The average cost of temporary disability cases was $70.34, of which $50.60 was for compensation and $19.74 for medical aid, the average in 1922 being $75.93, and in 1921, $80.77.

The average cost of a permanent disability case was $1,147.79, of which $198.45 was for temporary disability, $837.17 for permanent disability, and $112.17 for medical aid.

The average cost of a death case where there were dependants was $5,073.23, and the average cost for all death cases was $3,801.01, of which $12.40 was for temporary disability, $120.87 for burial expenses, $44.65 for medical aid, and $3,623.09 for death benefits.

The average cost of all cases in which compensation was paid was $184.11, of which $157.03 was for compensation and $27.08 for medical aid, as compared with $194.60 for 1922, and $213.26 for 1921. Increase in proportion of smaller accidents reduces average costs.

The average cost of medical aid in medical aid only cases was $5.01, as compared with $5.21 in 1922, and $5.19 in 1921.

Allegiance of Injured

Table 21 shows the allegiance of injured workmen who received compensation, as taken from their own reports. There were 27,397, or nearly 87 per cent., of British allegiance, and 4,224 of foreign allegiance. Among those of foreign allegiance the most numerous were Italians, Poles, Austrians, Russians, and Finlanders, in the order named.

Sex and Marital Condition of Injured

Table 22 shows the sex and marital condition of those receiving compensation. There were 31,203 males and 418 females. Of the males, 18,013 were married, and of the females, 34. There were 569 widowers and 44 widows.

Duration of Disability

Table 23 shows the week of termination of temporary disability cases. In 48 per cent. of these cases the disability terminated in from one to two weeks, and in 19.45 per cent. of them in from two to three weeks. In 9 cases the disability lasted more than a year.

Nature of Injuries

The first part of Table 24 shows the number of the various kinds of temporary disability injuries in the different classes of industry, the second part gives an analysis of the permanent disability cases showing the number of injuries to each of the different parts of the body and the percentages of impairment of earning capacity, and the third part of the table shows the number and nature of the industrial disease cases.

During 1923 there were 10,245 cuts, lacerations, and punctures; 7,396 bruises and abrasions; 2,760 sprains; 2,689 fractures; 2,520 crushing injuries; 238 dislocations; and 138 herniae, among the temporary disability injuries.

Among the 2,340 permanent disability cases 30 were total permanent disability and 375 exceeded 10 per cent. of total earning capacity.

There were 65 industrial disease cases, 59 of them being lead poisoning and 6 mercury poisoning, one of the latter causing permanent disability.

Causes of Accidents

Table 25 gives the prime causes of accidents in 1923. Machinery was responsible for only 11,760 cases out of a total of 51,746, or 22.73 per cent. of

all cases, the percentage in 1922 being 26.06, 1921, 24.4, and 1920, 31.42. Among machinery, abrasive wheels, saws, presses, pneumatic tools, and belts and pulleys were the most frequent agents of injury. Handling of objects or material was the most frequent of all causes of accidents, followed by falling of the workmen from a height or on the level, using tools, being hit by flying objects, and stepping on or striking against objects.

Blood-Poisoning Cases

The number of compensation cases in which the seriousness of the accident was due to concurrent or subsequent infection rather than to the nature of the wound is given in Table 26. There were 2,962 such cases, or 9.37 per cent. of all cases compensated, including 38 cases of permanent disability and 15 deaths.

Death Cases

The nature of awards, the number, relationship, and residence of the dependants, and other particulars of death cases are shown in Table 27.

APPENDIX

Summary of Compensation and Medical Aid Awarded

From Commencement of Act to End of 1924

Compensation Awarded

Schedule 1 Industries	$30,569,500 47
Schedule 2 (including Crown Cases)	10,835,810 65
Total Compensation	$41,405,311 12

Medical Aid Paid

Schedule 1 Industries	$4,523,340 94
Schedule 2 (including Crown Cases)	Furnished by Employer
Total Benefits Awarded by Board	$45,928,652 06

Summary of Accidents Reported

From Commencement of Act to End of 1924

Schedule 1 Industries	368,547
Schedule 2 (including Crown Cases)	73,455
Total Number of Accidents Reported	442,002

Financial Statement for Schedule 1 Industries

From Commencement of Act to End of 1924

Income and Credits

Net assessments received	$35,654,141 04
Received under Section 74 (4)	700 00
Received under Section 93a	57,463 77
Received under Section 99 (3)	2,312 62
Received under Section 9	37,169 54
Received from D.S.C.R.	32,993 57
Interest received	1,089,152 62
Credited from Disaster Reserve	97,000 00
Credited from Pension Fund	600,000 00
Assessments estimated to be due on adjustment of 1924 pay rolls	791,177 92
Deficit owing by classes	7,678 03
	$38,369,789 11

Expenditure and Charges

Compensation paid other than pensions, compensation deferred, and under Secs. 22a and 36	$15,250,829 47
Pensions awarded	14,887,261 01
Deferred Compensation awarded	430,371 84
Paid under Section 22a	996 40
Paid under Section 36	41 75
Medical Aid paid	4,523,340 94
Administration Expenses paid	965,625 19
Paid to Safety Associations	506,951 50
Transferred to Disaster Reserve	285,555 19
Compensation estimated outstanding	1,377,604 76
Medical Aid estimated outstanding	141,211 06
	$38,369,789 11

Summary of Pension Fund, Schedule 1

From Commencement of Act to End of 1924

Pension awards	$14,887,261 01
Interest added	2,666,978 59
	$17,554,239 60
Pension payments	4,520,952 97
	$13,033,286 63
Amount transferred to Current Fund, January 1, 1924	600,000 00

REPORT OF THE

ONTARIO VETERINARY COLLEGE

To The Honourable John S. Martin,
Minister of Agriculture.

Sir:—

I have the honour to present herewith the following report of the Ontario Veterinary College for the year extending from November 1st, 1923, to October 31st, 1924. During the year considerable improvements have been made. The grounds surrounding the buildings have been levelled and terraced, adding greatly to the general appearance and attractiveness of the place. Among the notable events at the College a brief reference is made to the Annual Commencement Exercises and Presentation of Prizes which took place on November 14th, 1923. The chief speaker was Sir Robert A. Falconer, President of the University of Toronto, who also presented the prizes to the successful candidates. The meeting was presided over by me as Principal of the College. The opportunity was availed of to outline the relation of the College to agriculture and in particular the value of veterinary science to successful animal industry.

In addressing the meeting President Falconer referred to the fine educational institutions becoming established in Canada as an evidence that our country was now attaining a relatively advanced position among the nations of the world. It was also becoming more fully realized that in acquiring a professional education the primary thing was not merely technical skill, but a greater means of preparing the mind to make it possible for the professional man to become not only a first class technician but with a much wider knowledge so that he could adjust himself to an environment and become master of it. In fact, education should not be judged by the mere technical skill of the moment. The professional man to be properly qualified requires in addition to technical skill a measure of liberal education so that he could take a broad, well-balanced view of things, and gradually come to a reasoned judgment instead of arriving at hasty conclusions and giving snap verdicts. A country might sometimes be too easily swayed by things that appealed to the thoughtless, hence it was vitally necessary that the people should pay more attention to education and be in a position to take their part intelligently. To this end the educated mind saw things worth seeing through the power of more accurate observation. In concluding, President Falconer pointed out that the professional man's primary object, after the ordinary demands of living were satisfied, was not merely to accumulate wealth but to make some sort of return for the education received from the state by giving faithful service to the public who had made their profession possible.

Attendance

For the session which ended April 30th, 1924, a total of 70 students were in attendance, of which 15 were in the first year class, 14 in the second year class, 15 in the third year class, and 26 in the senior class. Of the senior class all were successful in passing the final examinations, and were graduated with the

Degree of Bachelor of Veterinary Science (B.V.Sc.) conferred by the University of Toronto. During the present session which commenced on October 1st, 1924, a total of 63 students have been enrolled, of which 22 are in the first year class, 13 in the second year class, 13 in the third year class, and 15 in the senior or graduating class. From the foregoing it will be noticed that there is a substantial increase in the first year class, making a more hopeful and encouraging outlook for the future. Another gratifying feature is that the students now entering have a higher matriculation standing than formerly and as a result the average standing of the graduate is becoming much better.

The Teaching Staff

No additions in the personnel of the teaching staff have been made. Unfortunately, however, we sustained a severe loss through the death of Dr. F. Torrance as lecturer in physiology. While he had only been on the staff for a comparatively short time, he had won a high place in the affections of the student body as a careful, painstaking teacher. As a friend and colleague he was highly esteemed by myself and staff. As a testimony of this the following resolution was passed at a special meeting of the faculty: "That an expression of deepest regret at the death of Dr. F. Torrance and our high appreciation of him as a colleague, the services which he rendered to the College and veterinary education, his devotion to the welfare of the veterinary profession and live stock interests in Canada while Veterinary Director General, be recorded in our minutes."

The personnel of the College staff and their respective departments are as follows:

C. D. McGilvray, M.D.V., D.V.Sc., Principal: Contagious Diseases, Sanitary Service.
J. N. Pringle, M.R.C.V.S., B.V.Sc.: Sporadic Diseases, Dentistry.
R. A. McIntosh, M.D.V.: Diseases of Cattle, Obstetrics, Pharmacy, Therapeutics.
W. J. R. Fowler, V.S., B.V.Sc.: Surgery, Lameness, Materia Medica.
H. D. Nelson, B.V.Sc., D.V.Sc.: Anatomy.
R. Gwatkin, B.V.Sc., D.V.Sc.: Bacteriology, Milk Hygiene.
H. E. Batt, V.S., B.V.Sc.: Zoology, Histology, Meat Hygiene.
F. W. Schofield, B.V.Sc., D.V.Sc.: Pathology, Parasitology.
F. Torrance, B.A., D.V.Sc.: Physiology, Hygiene.
F. C. Grenside, V.S.: Horsemanship.
J. G. Harvey, V.S., V.B.Sc.: Canine and Feline Diseases.
G. A. Drew, Jurisprudence.
A. L. Shepherd, Executive Clerk.

The departments of the Ontario Agricultural College give instruction in the subjects of chemistry, animal husbandry, botany, English, civics and economics.

Instruction is given by the staff of the Veterinary College to agricultural students in the subjects of anatomy, materia medica, obstetrics and diseases of farm animals.

Respectfully submitted,

C. D. McGilvray,
Principal.

Guelph, Ontario,
October 31st, 1924.

THE COURSE OF STUDY AND INSTRUCTION

The curriculum is being revised as appears necessary from time to time. A marked advance and improvement is steadily being made in the general education now being extended to students in veterinary science. The facilities for clinical instruction are also being amplified. The subjects of instruction are briefly outlined in the College calender which is distributed to those interested.

RESEARCH AND INVESTIGATIONAL WORK

In addition to class lectures and other instructional work with students, several members of the College staff conduct such research and investigational work as their time and opportunity permits. This is a valuable feature for many reasons apart from the immediate results. It is especially valuable in creating an atmosphere offering an incentive to the thoughtful minded, diligent, painstaking student to pursue such studies as will develop a bent of mind for research work. The need for research and investigational work is generally realized, but the number of persons inclined and qualified for the purpose are relatively few. However, this will be overcome providing sufficient inducement is offered and the required facilities are provided.

There has arisen among poultry men a demand that the diseases affecting fowls be inquired into, and that the best means and methods of controlling outbreaks shall be discovered and made known. The College is endeavouring to meet this, and during the last two years a good deal of effort and thought has been applied to the subject of poultry diseases. Several of the departments in the College have been concerned in this work, each contributing its share to the general results. A certain amount of difficulty is met with owing to the fact that the study of poultry diseases is comparatively new. There exists no great amount of scientific literature on this subject; what there is, however, is made full use of. The published results of research workers in Europe, the United States, and in Canada have been valuable aids and are fully appreciated. When a detailed study of the diseases of poultry was begun at the College, methods were used similar to those adopted when disease conditions in larger animals are being investigated; that is, both bacteriological and pathological studies were made. It was then found that little was known of the normal histology of the fowl, a knowledge of which is essential if diseases are to be studied understandingly. There are many scattered references in works on zoology and other text books as to the normal histology of birds, but there appear to be few available that give in detail a consecutive description of the microscopic anatomical characteristics of the domestic fowl. In the laboratories of the College the microscopic anatomy of the domestic fowl is being carefully worked out. It is intended to continue this study until the whole minute anatomy of the fowl has been inquired into.

The extension service by means of which veterinary surgeons and owners of animals can send certain specimens to the College for laboratory examination is being freely availed of and is being appreciated by those receiving benefit. During the year the following work has been undertaken:—

The publication of a bulletin on infectious abortion in cattle.

The publication of a bulletin on diseases of poultry.

A study of the gross and histological anatomy of the fowl.

A study of chickenpox, diphtheria, roup and canker in fowl.

A study of bacterium pullorum infection in adult birds and white scours in chickens.

A study of blackhead and white diarrhea.
A study of sterility in cattle.
A wider application of the agglutination test for abortion.
The preparation and distribution of abortion vaccines.
The preparation and distribution of joint-ill vaccine.
The experimental and investigational work conducted by each department is described under their respective headings.

CLINICAL DEPARTMENT

The work of this department embraces the applied branches of veterinary medicine and surgery. All animals brought to the College are carefully examined after which treatment is prescribed and operations are performed as may appear advisable. Complete records are kept of all cases and the available material is made use of to impart instruction to the students by regular lectures and special demonstrations. The clinical instruction has been carefully arranged and field investigations have been conducted whenever possible. Much time has been devoted to infectious abortion and sterility in cows. Many valuable cows have been treated for sterility at the College, and as a result a considerable number have been restored to breeding usefulness. Several special articles relating to interesting cases have been prepared and are embodied in the report. The different clinical cases used for instructional purposes are included in a report submitted by the clinical department of which the following is a synopsis.

Swine Clinics

Number of Animals	Nature of Case	Remarks
9	Scrotal Hernia	Surgical operation.

RETAINED PLACENTA AND ITS SEQUELAE IN COWS

By R. A. McIntosh, M.D.V.

This disease is quite prevalent and it has become somewhat of a problem both for the stockman and the veterinarian. Not only in itself is it serious but also because of conditions which may follow and permanently interfere with the breeding usefulness of animals affected. The successful treatment of this condition requires a thorough knowledge of the normal development of the fetal membranes and also what occurs pathologically to cause retention. The nongravid uterus in the cow is situated in the pelvic cavity being held in position by the broad ligament and its continuity with the vaginal walls. It is composed of a strong sphincter-like segment known as the cervix, a comparatively short body, and a right and left cornua which taper down to a small point and curve around on themselves. The bovine fetus is always developed in one of the cornua, and more commonly in the right than the left. Following conception, the fertilized ovum quickly passes into the embryonic stage, being nourished by the secretions of the uterus during this time. As the fetus grows and the demand for nutrition becomes greater, certain membranous structures grow out from the umbilicus carrying with them the fetal blood vessels. The outer membranous sac completely envelops the fetus, its external surface coming in contact with the uterine walls to which it becomes attached in certain specialized areas. Once this connection has become established it is the medium through which the fetus receives its nutrition and eliminates its waste products.

The term cotyledon is applied to those specialized areas of the uterus to which the placental tufts of the fetal appendages become connected. Both the maternal cotyledon and the placental tuft are richly supplied with blood vessels. Those of the cotyledon having their origin in the many ramifications of the uterine arteries and those of the placenta coming from the umbilical vessels. At first the cotyledon merely appears as a hyperemic area on the mucous surface of the uterus, but as time goes on it pushes itself out from the uterine wall, and at its greatest development appears as a mushroom-like protuberance on the surface of which are a large number of depressions known as crypts. The placental tuft which develops on the outer fetal membrane is somewhat similar in growth, except that on its surface papillae develop which fit and dovetail into the corresponding crypts of the cotyledon. The character of the cotyledonary and placental tissue is chiefly of budding endothelial cells for the continuous growth of blood capillaries throughout the gestation period to meet with the ever increasing demand for nutrition by the developing fetus. The relation of the maternal and fetal capillaries in the cotyledon is very intimate, for food and waste products are interchanged through their walls by the process of osmosis. The number of cotyledons varies from 40 to 60 in a single pregnancy. They reach their maximum development at the conclusion of the gestation period, being slightly oval in shape and measuring from 1 to 5 inches in their greatest diameter. Their size depends on their location and blood supply, the largest being found around the lesser curvature of the gravid horn in the area where the great middle uterine artery enters the uterine wall.

Normally at birth the muscular walls of the uterus contract so as to force its contents toward the cervix, which gradually dilates to the full dimension of the pelvic cavity. That portion of the fetal membrane related to the cervix is forced out into the vaginal passage by the fetal fluids under pressure of uterine contractions. They eventually rupture permitting the escape of the fluids after which the fetus is born. When the fetus is born the umbilical cord is

broken, thus severing the connection it had with the maternal uterus during intrauterine life. The rupture of the umbilical cord brings about a collapse of the placental blood vessels and permits the placental tufts to detach themselves from the cotyledons. Then with continued uterine contraction and involution in a few hours the placental membranes are also expelled from the uterus.

When retention of the placental membranes occurs, the lesions preventing their detachment exists in the cotyledon and placental tuft, for this is their only point of contact with the uterus. In studying this disease and searching out its causes it is found that they may be placed under two headings, namely, contributory and actual or exciting.

Contributory causes are chiefly related to the improper care and management of a herd.

Poor housing facilities.

Lack of exercise.

Improper feeding.

Improper hygiene and sanitation.

Carelessness in sex hygiene.

The significance of the first four items lies chiefly in the fact that they tend to lower disease resisting powers of the animal. The last item is the most important, for the uterus may become infected in cows that are bred with an abnormal genital discharge.

The actual cause and the great factor in the production of this disease is inflammation of the cotyledonary and placental structures which has occurred as a result of uterine infection. This fact is well substantiated in abortion disease where a cotyledonary infection is known and retained placenta most common. An inflammation in these structures behaves in much the same manner that it does in other tissues.

There is a congestion.

Exudates are thrown out.

Swelling and pain occurs.

The inflammation may be so acute and the swelling so intense as to cause necrosis of the placental tufts imprisoned in the cotyledonary villi, thus interfering with the nutrition of the fetus, causing its death and expulsion, or expulsion in a weak state.

The exudate may organize.

Resolution of the inflammation with permanent adhesions.

In cases of retained placenta it will be noticed that the lesions which cause retention vary considerably in many instances. In some cases only a few of the cotyledons are diseased, in others, parts of cotyledons will be affected. In the majority of cases, however, the most of the cotyledons are diseased and the placenta adherent to them.

Inflammatory conditions in the cotyledons not only causes retention of the fetal membranes but also affects the tone of the uterine walls so that they are more or less paretic, in some cases this is so marked that uterine contractions are entirely absent.

Veterinarians called upon to treat this condition meet with it in a variety of forms and at various stages. From the recently calved cow down to the one that has been neglected for days and in some cases weeks, with the patient so debilitated through toxemia that she is little more than a living skeleton.

The Treatment and Handling

Methods of Prevention.

Proper care and management of the herd.

Reasonable amount of exercise for pregnant cows.

Attention to diet:—properly balanced ration.

Hygiene and sanitation:—cleanliness, maternity stalls, proper disposal of soiled litter.

Sex hygiene:—cows with abnormal discharges from the genital tract should not be bred until cleaned up.

Methods of Handling.

With some live stock breeders this disease is not given due consideration. This may be partly due to the fact that the ordinary grade cow does not seem to be so seriously affected by it or subsequent attention required. In the finely bred sensitive dairy cow, however, it is a matter of considerable importance and should not be regarded lightly. Its treatment requires good judgment and special care to bring it to a successful conclusion. This is true not only so far as the disease itself is concerned, but also because of the many complications and sequelae which may follow it.

In the treatment of this disease no dogmatic rule can be laid down and applied in a general way. Each case should be given due consideration and a treatment adopted which will meet with its requirements. There are a few rules which may be applied in all cases, however, as:—

Isolation of affected animals in a suitable stall.

A light diet of a laxative character provided.

Every possible means should be taken to preserve the health and vitality of the patient.

Manual removal of the membranes is commonly practised and can be justified in many cases, but should only be attempted when they can be detached without irritation, pain or hemorrhage. These points serve as a guide in this procedure. The symptoms of excessive straining, the escape of blood and frequent defecation in manual removal are warnings of the possibility of serious results following and it would be better to defer the operation.

If upon examination it is found that the placenta cannot be easily detached, irrigation in some cases may be useful, but as a rule little good can be accomplished. Probably the most effectual procedure to follow is to place in the uterus, capsules containing Boric Acid and Iodoform or inject into it a suspension of these agents in Mineral Oil. They allay irritation and discourage or inhibit putrefactive changes until such time as the placental tufts have become sufficiently detached to permit removal. Subsequent treatment consists of irrigation with warm normal saline solution or other mild antiseptic. Rectal massage of the uterus will also frequently assist in the removal of exudates and restoring the organ to its normal state. All manipulations of the uterus should be gently performed, for it is easily injured in a state of disease. It is also a good rule to have the temperature recorded at regular intervals, for any material rise in it may indicate a severe metritis with sapremia. Internal medication in general consists of administration of systemic stimulants, digestive tonics, intestinal antiseptics and anti-rheumatics.

Sequelae.—Retention of the placenta is quite often followed by chronic inflammations and other lesions affecting the organs of the genital tract which interfere with reproduction. Amongst these ovarian disease sometimes occurs, cystic degeneration taking place which invariably prevents conception. In these cases the animal acquires a perverted sexual desire, is constantly in heat, and will accept service from the male animal at any time. Other diseased conditions of the ovary occur also. Infection may pass through the oviduct and adhesions form around the ovary which will prevent it functioning in a normal way.

The oviduct is occasionally diseased as a result of retained placenta. Inflammation of the duct (salpingitis) occurs, adhesions follow, and in some cases cysts form along the course of it. These lesions may involve the lumen of the tube and prevent the passage of the ovum from the ovary to the uterus.

A chronic metritis is quite a common sequel. In that state the uterus is continually discharging abnormal secretions which prevent conception by causing the death of the spermatozoa and the fertilized ovum. In some instances these exudates accumulate in the uterus and produce a hydrometra or a pyometra depending upon the character of the fluid.

Another common sequel is cervicitis which is usually brought about by irritation and infection from material discharged from a diseased uterus. If the cervix is diseased in this way it becomes greatly tumified, sensitive, bleeds easily, and later on indurated and hard.

In the vagina, strictures, adhesions and chronic inflammations are occasionally seen.

IMPOTENCY IN BULLS

By R. A. McIntosh, M.D.V.

The breeding efficiency of the herd is a matter of extreme importance to the live stock owner. When confronted with reduced breeding efficiency the question of the herd sire's potency or powers of fertilization should not be overlooked. In some instances the interference with reproduction in the herd can be traced to him. In reaching a decision regarding the potency of a sire, the breeding history of the herd supplemented by a microscopic examination of his spermatozoa will generally enable a proper conclusion as to his powers of fertilization.

To obtain spermatozoa for microscopic examination the method of procedure is as follows:—

A cow in estrum is obtained.

The external genitals are washed clean.

The vagina is flushed with a warm normal saline solution, and then swabbed out with absorbent cotton to remove all excess fluid and exudate that may have accumulated in it.

The bull to be examined is then permitted to serve the cow.

A sample of the seminal fluid is then obtained from the vagina. If a microscope is available for immediate examination, a swab can be introduced into the vagina to get a sample of the seminal fluid. It is then smeared upon a glass slide, a cover slip placed on it, and examined immediately in a warm place.

Where it is necessary to convey the seminal fluid any distance for examination, a quantity of it may be obtained by inserting the hand into the vagina and scooping it out into a suitable container. If the heat of the sample is kept up to body temperature, motility of the spermatozoa will be maintained for a few hours. The shape and conformity of the spermatozoa remains unaltered for a considerable time after they have lost their motility, and the sample may be microscopically examined in that respect for two or three days afterwards.

The following cases are submitted as examples of cases dealt with in the clinic:—

Impaired Sexual Efficiency
Clinic Case No. 83

History.—This animal was a Shorthorn bull, six years old, of a good family strain, possessing conformation and breed characteristics that made him an outstanding individual as a herd sire. He was presented for examination and treatment on January 4th, 1923. He had been purchased about six months previous and after using him for service for about five months it was found that only about one-third of the females served by him were conceiving. Formerly the breeding standard of these females had been satisfactory to the service of another bull. At the time of examination he was in good flesh, almost too fat if anything. His coat was lacking in lustre and his movements were sluggish. The body functions were physically normal and when permitted to serve a cow the act was performed in a natural manner. The genital organs were normal in appearance.

Diagnosis.—Partial impotency, due to lack of vitality in the spermatozoa. This decision was arrived at by the history of the case supported by a microscopic examination of the semen. Immediately after service a small quantity of the seminal fluid was taken from the vagina of the cow and examined under the microscope. It was plainly evident that only a comparatively small number of the spermatozoa were motile and that a few of them were altered in shape and deformed. The majority of them, however, were apparently normal in shape, but non-motile. Several examinations were made of samples of the semen and immotility of the spermatozoa was constant on each occasion.

Treatment.—Some slight changes were made in the ration, providing for a reduced amount and a larger variety of food of a laxative nature. A definite and regular amount of daily exercise was enforced requiring the animal to walk at least one mile every day. The medicinal treatment consisted of a sexual tonic. This was administered over a period of two weeks as a stimulant to the sexual organs and to improve the spermatozoa. For this purpose, one pound of Elixir Yohimbehe Compound was given in half-ounce doses three times a day, supplemented by a hypodermic injection of Yohimbin Hydrochloride every alternate day. The Elixir mentioned contains strychnine and phosphorus combined with the active principles of the bark of the Yohimbehe tree compounded in a suitable form.

Results.—On February 13th, after four weeks' treatment, another examination of the seminal fluid was made. At this time it was found that a marked improvement in the motility of the spermatozoa had resulted. A larger number of them were noticed to be actively motile. In addition to the general improvement noticed in the motility of the spermatozoa, as discerned by the microscope, very favourable reports were received from the herd manager, to the effect that the cows being bred to this bull were not now being returned so frequently for service. By the end of April a much larger percentage of the cows had conceived than formerly. Since then this animal is proving quite satisfactory as a herd sire, maintaining a good standard of breeding efficiency.

Incurable Impotency
Clinic Case No. 357

History.—The subject in this case was a three-year-old Shorthorn bull, which had been purchased the previous year at a dispersion sale, and was sold under guarantee to be a breeder. The purchaser after using him for service on his cows found that none of them were conceiving. After about six months

trial he was returned to the seller. On April 21st, 1924, he was submitted to the College clinic for examination. In general appearance the animal looked thrifty and quite active in his movements. In examining the genital organs the testicles appeared normal in size, but on manipulation were found to be lacking in consistency, and not as firm and clearly defined as they should be. By rectal manipulation the seminal vesicles, the prostrate glands, and the urethra were examined. As far as could be determined these structures were normal. A microscopic examination of the semen was deemed necessary. The opportunity for this was provided on April 23rd, when a cow which was in sesaon was obtained and this bull permitted to serve her. At service he was quite keen and performed the act in a natural manner. As soon as service was completed a sample of the seminal fluid was removed from the vagina of the cow. A slide was prepared in the usual manner and examined under the microscope. It was impossible to detect any normal spermatozoa, clearly indicating that there was some condition affecting the testicles interfering with the production of the generative cells. It was decided to make a further examination at a later date. In the meantime the animal was kept under observation, regular daily exercise was given and the diet regulated. On May 20th another cow in season was obtained and the bull permitted to serve her three times during the day. Samples of the seminal fluid of each service were obtained and examined microscopically. In each instance it was found that the spermatozoa were noticeably deformed, non-motile and incapable of fertilization. The owner was therefore informed that this bull was incurably impotent and he decided to have it slaughtered. This was done on May 27th, and the genital organs were taken for further histological examination. For this purpose portions of both testicles, of the epididymus, and of the seminal vesicles were prepared for section. When sectioned and microscopically examined, the epididymus and seminal vesicles were found to be normal in structure. In the case of the testicles it was noticed that the cells of the seminiferous tubules which generate the spermatozoa were undergoing a process of degeneration, and that none of the tubules under microscopic examination could be found which were secreting normal spermatozoa. Instead, they were giving off cells which represented spermatozoa but were incomplete, the body and head of each being misshapen, with the tail in many of them entirely absent, indicating an arrest in their development. No definite reason for the condition affecting this bull could be determined and the only explanation to be offered is that it was probably due to an arrest in the development of the testicles. The available information did not warrant the conclusion that it was caused as the result of excessive sexual use when too young.

STERILITY IN COWS

By R. A. McIntosh, M.D.V.

The study and treatment of sterility affecting valuable breeding cows is conducted as a routine measure of extension service by the College. During the year sixty special cases have been handled for breeders. The causes of sterility are varied, probably the most common lesion is a cervicitis, although the ovaries are also quite frequently abnormal. Sometimes the uterus itself is the seat of the disease and occasionally the oviducts. Each animal presented for treatment is systematically examined and closely studied as regards its history. The data in each case are carefully tabulated so that the available records will from time to time furnish much valuable information. As examples of the different cases handled, the following clinical reports are cited from our records.

Retained Corpus Luteum

Clinic case No. 108

History.—A valuable pure bred Shorthorn cow aged six years had been bred and conceived as a two year old during the month of September, 1919. On April 12th, 1920, she aborted this calf in the seventh month of her gestation period. During the remainder of that year her estral periods were very irregular and being in heat on November 13th she was bred. Following this service she did not come in heat until September 17th, 1921, at which time she was again served. She was not observed in heat again until January 6th, 1922, and again on January 21st but was not bred. On all occasions of heat she did not manifest it in the usual way, and it was difficult to tell whether she was in season or not.

Examination.—She was brought to the clinic for examination on January 24th, 1923. She was very fat, a general condition that is common to many sterile cows of the beef breeds. An examination of the genital organs revealed: the vulva, vagina and cervix to be normal, the uterus lacking in tone and too flabby, the right ovary rather small but containing a corpus luteum, the left ovary quite large and containing a prominent corpus luteum.

Diagnosis.—Sterility due to uterine inertia and retained corpus luteum.

Treatment.—The initial treatment consisted of a vaginal douche with normal saline solution, massage of the uterus, and expression of the corpus luteum from the left ovary. A week later the uterus was irrigated by means of a return flow catheter with a .25 per cent. Lugol's solution followed with a normal saline solution and finally massage. On February 3rd this treatment was repeated, and on February 10th the corpus luteum was expressed from the right ovary. The uterus was again massaged and the vagina douched. Estrum occurred on February 13th and was very pronounced. At this period of heat the vagina was flushed with a warm normal saline solution and then in two hours time she was bred. Following this service her next estral cycle was due on March 6th which she passed without coming in season. On May 2nd, 1923, she was examined for pregnancy and found to be in calf, hence was discharged from the clinic.

Cystic Degeneration of the Ovaries

History.—A high producing Holstein-Friesian cow aged seven years brought to the clinic for examination. The owner stated that she had given birth to three calves normally, the last one being born during the month of February, 1923. Following this, she was bred several times, but seemed to be continually in season and manifesting sexual desire by mounting other members of the herd.

Examination.—She was examined on July 11th, 1924. Her general appearance denoted unthriftiness, and she appeared nervous and excitable. An examination of the genital organs revealed: the vulva inclining to a horizontal position, the vagina and cervix normal, the uterus very flabby and decidedly lacking in tone, both of the ovaries were cystic.

Diagnosis.—A nymphomaniac due to cystic degeneration of the ovaries with unfavourable prospects for recovery. This opinion was formed because pelvic deformity due to ovarian disease was well marked, the sacro-sciatic ligament had become sunken allowing the tail head to project upwards, and the anus and vulva were drawn forward in a more or less horizontal position. This is clearly shown in the accompanying illustration of this cow.

Treatment.—The hand was inserted into the vagina and the cysts in both ovaries were ruptured and the uterus was massaged. On July 15th a cyst had

again developed on the right ovary which was ruptured and the uterus again massaged. Three days later another examination, no cysts present, a slight bloody discharge was observed coming from the uterus, hence the uterus was massaged and the vagina douched with boric acid solution. On July 21st another cyst had formed in the left ovary, which was ruptured and the uterus again massaged. Three days later no cysts were present. On July 28th another cyst had formed on the right ovary, which was ruptured and the uterus again massaged. Following this, examinations were made every third day up to and including August 7th. During this interval no cysts had developed and the cow was removed to the owner's premises. Two days later, on August 9th, she appeared in season and was bred. On August 22nd the owner reported that the cow apparently had a relapse to her former condition and was again manifesting sexual desire continuously. On October 9th the cow was examined

Clinic Case No. 411.
Cystic ovaries in cow. Note the altered appearance of the rump with the "tail-head" elevated and hollows on each side.

again on the owner's premises, revealing that she had not conceived and that a large cyst had developed on the left ovary. The case was therefore considered hopeless in so far as being able to restore this animal to breeding usefulness.

A Free-Martin or Sex Neuter

Clinic case No. 91

History.—A pure bred Shorthorn heifer rising three years old. This heifer was one of a twin pregnancy in which both sexes were represented and the offspring of a valuable breeding cow and a noted sire. She had been kept for two years without ever showing any signs of being in season.

Examination.—Externally the genital organs appeared normal. Inwardly the fingers of the operator could be introduced into the vulva only as far as the hymen at which point the passage came to an end. By rectal examination no tangible evidence of any of the organs of the genital tract could be detected.

Diagnosis.—A Free-Martin or Sex Neuter, which is the name applied to a female twin calf whose mate is a male. In these cases of twin pregnancies comprising the male and female sexes the female is invariably imperfect sexually and will seldom breed. In many cases, as in this one, such an animal does not come in season and does not show any inclination for the bull. Their generative

organs are imperfect and nothing can be done to make them breeders. The owner was therefore, in this case, advised to slaughter the heifer for beef. When the animal was slaughtered the genital organs were examined and found to be imperfect. There was no vaginal passage, cervix, or uterine body present, but on the anterior border of the broad ligament two small remnants of uterine cornua about an inch long could be picked up. There were no oviducts and the ovaries were represented by two small pea-shaped bodies somewhat darker in colour than the related structures and situated at the extremity of the utero-ovarian ligaments.

A Prolific Aborter

Clinic case No. 436

History.—This was a high producing Holstein-Friesian cow, aged eight years. She was especially valuable on account of her high producing milk capacity and because her progeny were proving to be exceptional producers and splendid individuals of the breed. She had been pregnant four times and given birth to four calves normally. When pregnant the fifth time she aborted triplets in about three months. She was allowed to clean up and bred again, conceiving at once but again aborted triplets between the second and third months. In due time she was again bred; she conceived to this service and aborted twins when between two and three months' pregnant. For a fourth time she was bred and again conceived, only to be followed by aborting twin fetuses. The sum total of her abortions included ten fetuses in about twenty months' time. She was admitted to the clinic on July 21st, 1924. The treatment adopted consisted of the usual methods of sexual douching and uterine massage which was continued every third day from July 22nd to August 26th inclusive. On September 24th she came in season and was bred. She was discharged from the clinic on October 15th, and a report received on December 1st, 1924, stated that she had conceived. Three agglutination tests were made of blood samples from this cow on July 24th, September 7th, and October 7th, respectively, with negative results in each instance. This case is being mentioned at this time owing to its interesting features and the final outcome will be furnished in a subsequent report.

STOMACH WORM DISEASE IN SHEEP

By R. A. McIntosh, M.D.V.

This is a disease occurring in sheep caused by a parasite commonly known as the stomach worm. It is a round worm (a nematode) called the *Hæmonchus contortus*. The body of the worm is filiform, being attenuated at its extremities. It is from one-half to three-quarters of an inch long and red or greyish white in colour. In heavy infestations thousands of them may be found in the stomach. The sheep and the lambs probably get the infection by grazing on pasturage, or drinking water which has been contaminated with the larva of the parasite. When the larva gets into the digestive tract the parasite grows and develops, receiving its nourishment by attaching itself to the lining membrane of the stomach and sucking blood from the walls of the organ.

On a number of occasions outbreaks of stomach worm disease have been referred to the College for diagnosis and control. In one valuable flock of breeding sheep which came directly under our supervision, the condition was just commencing to become serious. A number of lambs died, a few were quite sick, others were showing slight manifestations of the disease.

Conditions favourable to an outbreak of this disease are: Overstocking, pasturing continually on the same pasture, hot dry summers, unsanitary water supply, together with other improper management. These parasites inhabit the true stomach, which is the abomasum of sheep, and produce so much irritation in it as to cause a gastritis which is very often followed by a profuse diarrhea. The disease does not manifest itself in any marked way in the adult sheep only in exceptional cases, and while they are frequently infested they seem to carry the parasite with impunity. In lambs, however, in some outbreaks the mortality is high and many of those which recover are so debilitated and stunted that they never do well.

Symptoms.—Probably the first noticeable manifestation will be a lack of sprightliness in the lamb. The wool becomes harsh and dry and in the later stages is easily pulled out. The temperature is high, very often four or five degrees above normal. They drink more water, seek shady places, lying there in preference to following their dam. They lose flesh rapidly. A closer examination reveals anemia, and as the disease progresses diarrhea sets in, which becomes quite profuse, the buttocks and hind legs being stained with fecal discharges. Swellings, edematous in character, are seen in some cases in the submaxillary space and along the ventral surface of the thorax and abdomen.

The clinical diagnosis is based upon the history of overstocking, repeated pasturing on the same land and under bad management otherwise. Also that it is the lambs which are chiefly affected, to emaciation, anemia and diarrhea. Diagnosis may be further substantiated by the use of a microscope, which may be determined as follows: A small amount of the feces is placed upon a glass slide to which is added a drop or two of water or sodium hydroxide solution, to so dilute it as to make it transparent. A cover slip is then placed on the solution and it is examined under the microscope. If the lamb is infested with the parasite, large numbers of eggs or ova will be found in the sample examined, and in some cases the form and outline of the parasite can be seen moving in its covering.

Prevention and Treatment.—Preventive measures in this disease are quite effectual and consist of:—

Keeping the flock down to such a number as can be properly cared for.

A change of pasturage from year to year.

Sanitary water supply provided at all times.

Suitable stabling quarters in the winter with feeding racks so arranged that the food does not become contaminated with the feces.

By fasting the pregnant ewes for eighteen or twenty-four hours, and then administering four ounces of one per cent. solution of copper sulphate once a month destroys the most of the parasites they may be harbouring.

This procedure may be followed out with the lambs as soon as they are turned out on pasturage with their mothers, the dosage being reduced to about one-half the amount administered to the adult.

In handling an outbreak of the disease the following suggestions are of value:—

Change the pasturage or ranging ground at once, also the water supply if it is from an unsanitary source.

Provide cool, shady places for those members of the flock that are sick.

Dose all of the flock, both the sheep and the lambs, with a one per cent. solution of copper sulphate in four and three ounce doses, respectively, repeat the dosage in a week's time, continuing this procedure until the disease is controlled.

DEPARTMENTS OF HISTOLOGY AND APPLIED PATHOLOGY

The work of these departments embraces instruction of the students by lectures and laboratory exercises in Zoology, Embryology, Histology, and Meat Hygiene. As in former years, the usual routine of teaching and demonstrating has been followed, except that in some cases slight changes that were considered necessary to improve the courses were made. For instance, in the case of Zoology, it was thought proper to hold a separate examination in this subject, so that there is now a special examination in Zoology.

At the request of the veterinarians and live stock owners of the Province, the laboratories have carried out investigations as to the cause of death of many animals. This service is growing and many more reports were sent out during the past year than formerly. Wherever possible the specimens sent in for examination are used for purposes of demonstration in the College class rooms.

The various diseases dealt with and the number and kinds of animals involved are indicated in the following tabulation:—

Nature of Case	Cattle	Sheep	Horses	Swine	Dogs	Cats	Foxes	Rabbits	Fowls	Total
Tuberculosis	5								5	10
Tumors	12		7		8				16	43

Ten samples of sweet clover were tested for moulds.

Three samples of water were examined for contamination.

During the year special histological studies were conducted by H. E. Batt,

B.V.Sc., of this department. Selected articles relating to the work undertake by him are included in the report as appendices under the following headings:—

"A study of the normal histology of the domesticated fowl."

"Some notes upon neoplasms as they are observed to occur in domesticated animals."

A STUDY OF THE NORMAL HISTOLOGY OF THE DOMESTIC FOWL

By H. E. Batt, B.V.Sc.

The following study of the intestinal tract of the domestic fowl does not pretend to be exhaustive, but should be considered as being a description in which the outstanding histological characteristics are given.

In comparing the digestive tract of the domestic fowl with that of a mammal, it will be found, that, while the general plan of both are much the same, there are organs present in the fowl that are not found in the mammal, namely, the crop, proventriculus, and gizzard. In the small intestines the same divisions are recognized, viz.:—Duodenum, jejunum, and ileum, while the duct from the pancreas and that from the liver open into the duodenum, as is the case in the mammal. The large intestine is considerably modified when compared with the same organ in the mammal. In the bird there are two long, blind ceca, while the large colon is relatively short, as is also the floating colon. The rectum opens into the cloaca into which sac-like structures the genital and urinary organs also empty, each by a separate orifice. The liver of the fowl is well developed and comparatively large, with a well-marked gall bladder (this last organ is absent in some species of birds). A pancreas is present in the same position as that organ is found in the mammal.

The microscopic anatomical structures in the intestine of the fowl differ in certain characteristics from those of the mammal. It will be found, however, that the same general histological plan is followed in both avian and mammal. There is no diaphragm present in birds, thus both thoracic and abdominal cavities are one.

Esophagus

The outer coat consists of a fibrous tissue layer and serves to unite the organ to adjacent structures. The same arrangement is present in the mammal. After leaving the mediastinal space a serous coat is present.

Muscular Coat of Esophagus.—This, as is the case in the mammal, consists of two well-marked layers of muscle, an outer longitudinal and an inner circular between which is a narrow band of connective tissue. In the fowl these muscles are all involuntary, there being few if any voluntary muscle fibres in the walls of the upper esophagus. Between the outer and inner muscle coats is found the myenteric nerve (Auerbach's plexus) which is well developed in the fowl.

Submucosa of Esophagus.—This is a somewhat indistinct layer of white fibrous tissue not as well developed as is the case in the mammal.

Muscularis Mucosae.—This layer of unstriped muscle tissue shows a remarkable development when compared with the same structure in the esophagus of the mammal. In the fowl it consists of a heavy layer of involuntary muscle arranged longitudinally, being of about the same thickness as the outer longitudinal muscle layer.

Tunica Propria.—White fibrous tissue with some scattered muscle fibres. There are many wandering lymphatic cells in the tunica propria of the fowl.

Glands of Esophagus.—These show a remarkable development and consist of large numbers of mucous glands, together with many lymph follicles. They are most numerous in the upper esophagus. The mucous glands are of the compound sacculated type, with wide ducts opening on to the free surface of the mucous membrane. The body of the gland is situated in the tunica propria, just internal to the muscularis mucosa. A distinct capsule of fibrous tissue and muscle fibres surround each gland. The lymph follicles are numerous, some being in close proximity to the mucous gland. In many cases both mucous gland and lymph follicle are enclosed within the same capsule. Compared with the mammalian esophagus there are a great many more mucous glands present, while lymph follicles are not found in the mammalian esophagus.

Epithelium of Esophagus.—This is stratified squamous in type and is similar to that found in the mammalian esophagus.

The Crop or Ingluvies

This organ is a diverticulum of the esophagus, having the same histological features as the other portions of the organ, situated above and below. The mucous membrane of the crop is thrown into folds when the organ is empty. The muscular walls of the crop are continuous with those of the esophagus and are arranged in the same manner, namely, an outer longitudinal and an inner circular coat of involuntary muscle. Mucous glands and lymph follicles are present as in the esophagus.

On leaving the crop the esophagus passes back along the mediastinal space and gains the region of the superior aspect of the liver where it empties into the proventriculus, an organ particular to avians.

The Proventriculus

Sometimes spoken of as the glandular stomach of the bird, is an elongated thick-walled organ lying between the distal end of the esophagus and the gizzard. The proventriculus is about two inches long and its diameter is three times that of the esophagus. The walls of the proventriculus are thick and spongy, the lumen which is continuous with that of the esophagus being comparatively small.

Muscular Coat.—Microscopically examined, the muscular walls will be found to be identical with those of the esophagus, there being an outer and inner coat of involuntary muscle between which is the myenteric nerve.

The Submucosa is a narrow zone of white fibrous connective tissue whose fibres run longitudinally. In this layer are the blood and lymphatic vessels and nerve fibres.

The Muscularis Mucosae is well developed, having the appearance of a third layer of muscle arranged in a longitudinal manner.

Glands of Proventriculus.—Between the muscularis mucosa and the epithelium is a remarkable mass of straight tubular glands arranged in groups or pockets around the circumference of the lumen, giving the organ a lobulated appearance. The stroma between adjacent glands is very slight, consisting merely of a basement membrane with a few connective tissue cells and in this stroma run the blood vessels. The cells of the proventricular glands are somewhat oval in shape with a centrally placed nucleus.

The cytoplasm of the cell stains well with eosin. The cells are attached to the basement membrane with their long axis directed upwards at an angle. The basal ends of the cells proximate each other. The distal two-thirds of each cell is free from that of its neighbour. This arrangement gives them the appearance of a vast number of small leaves attached to a long thin stalk. The lumen of each gland is wide and they anastomose freely. The proventricular glands open upon the free surface of the mucous membrane, where their epithelium changes to that of the lumen of the organ which is simple columnar in type. The proventriculus, together with the gizzard, is considered to be analogous to the stomach of the mammal and, while there are some histological resemblances, there are also differences, notably in the manner in which the proventricular glands are arranged and also in the type of cells which compose these glands. In the proventriculus there are no marked acid and pepsin producing cells that are so characteristic of the mammalian gastric glands. The cells of the proventricular glands are all of one type which, from their staining reactions, resemble somewhat the acid producing or parietal cells of the mammalian stomach.

The lumen of the proventriculus always contains some ingesta, so that it is probable that the glands are secreting digestive fluids, but it is evident that as the food does not remain long in the organ most of the digestive action must be carried on after the food enters the gizzard.

The Epithelium of the proventriculus is simple columnar in type. There is an attempt at the formation of crypt-like openings into which the epithelium dips, but no well-marked crypts are present as is the case in the mammalian stomach.

Just before entering the gizzard the proventriculus becomes constricted to about half its circumference. This portion of the bowel is about one-half inch long with thin walls and a wide lumen. It is considered by some authorities to be a part of the proventriculus; by others, to be a portion of the esophagus. On section and microscopic examination, the walls are found to be similar to those of the esophagus and proventriculus, there being the same arrangement of tissues. The tunica propria contains many wandering lympoid cells, together with numerous lymphatic nodes.

The glands of this portion of the proventriculus resemble very closely those of the pylorus of the mammalian stomach, except that in the fowl they are more branched and not as coiled as are the mammalian pyloric glands. The epithelium of these glands is columnar in type

There are crypt-like structures present from the bottom of which the above-mentioned glands open.

The epithelial lining is of high columnar cells.

Judging from its histological characteristics the portion of the gut between the proventriculus proper and the gizzard may be considered analagous with the mammalian pylorus.

The Gizzard

This organ is immediately below the proventriculus. Its situation is just posterior to the liver. The gland is large and flattened with massive muscular walls that are distributed over nearly the whole of its surface, except that portion from which the small intestines leaves where the heavy dark red muscular coat is continued by a thick fibrous tissue wall

Muscle Coat.—The muscles are of the unstriped or involuntary variety. They form a massive wall that in some places is over an inch thick. Three

coats of muscle are present, a light outer longitudinal layer; a massive circular layer; and internal to these a heavy layer of oblique muscle fibres arranged in bundles with strands of connective tissue interposed. Between the outer and middle muscle layers is a well-developed myenteric nerve plexus. The outer surface of the organ is covered by peritoneum.

The Submucosa.—This is a dense layer of white fibrous connective tissue, the fibres of which are arranged in a circular manner. In this layer run blood and lymphatic vessels also nerve fibres.

Tunica Propria of the gizzard is composed of white fibrous tissue in the meshes of which are found scattered wandering cells (lymphocytes).

The inner lining of the gizzard is a thick coat of horn-like material, that grows from or is secreted by an epithelium that is arranged in a manner similar to that found in the matrix of the human nail or the malpighian layer of epithelial cells that produce the horn of the horse's foot. The cells of the epithelium are a single layer of cuboidal cells arranged in the form of lamellae that by their number and depth give the structures the appearance of glands. From these cells is derived the horny inner lining of the gizzard that appears as a structureless dense material, there being no cellular elements present in it as is the case in the hoof of the horse or in the human nail.

It is probable that the inner lining of the gizzard is a secretion of the special epithelial cells lining the lamina. The inner horny layer is thick and is thrown into many ridges, the surface of which are serrated. This roughened tough coat together with the pebbles that are swallowed and retained within the organ, serve to grind up the food. The grinding movements are brought about by the action of the powerful muscular walls of the organ.

In the proventriculus and gizzard there are no structures provided by which any absorption can take place, and it would appear from the nature of the inner lining of the gizzard that absorption from the organ is impossible.

It is possible, however, that in certain digestive disturbances, absorption may take place from the proventriculus, as is said to be the case in the mammalian stomach.

A digestive ferment known as ingluvin is active among the ingesta within the gizzard. This ferment is in all probability secreted by the proventricular glands.

The Small Intestine

The small intestine of the fowl does not differ in any marked degree from that of the mammal. In the fowl this part of the digestive tract is well developed and is about six feet in length, being attached to the roof of the abdominal cavity and to adjacent organs by well marked mesenteries. In the mesentery of the fowl there are no well-marked lymphatic glands as is the case in the mammal. Indeed the lymphatic glands, so prominent in the various parts and organs of mammals, are absent in birds. There is, however, a well-marked lymphatic system present in the intestinal tract of the domestic fowl, but it is found in the form of many solitary lymph nodes situated in the submucosa of the intestinal tract. These are not visible to the naked eye.

The Duodenum

The duodenum of the fowl leaves the gizzard and after forming a loop or turn, passes back and is continued as the jejunum. In the fold or loop of the duodenum is found the pancreas, which same arrangement is present in mammals. The bile duct and two pancreatic ducts open into the duodenum.

Serous Coat.—This is much similar to that of mammals. There are, however, many wandering cells (lymphocytes) in the subserous layer of the fowl.

Muscle Coat.—These, as in the mammal, consist of an outer longitudinal and an inner circular layer of involuntary muscle. The outer coat is much thinner than is the inner one, and is arranged in the form of bundles of muscle fibres, arranged in a longitudinal manner. The inner circular layer of muscle is massive. Between the outer and inner muscle coats is a zone of white fibrous tissue that serves as a supporting tissue for the myenteric nerve which is well developed.

Submucosa.—The submucosa is a narrow zone of dense white fibrous tissue in which are found blood and lymphatic vessels.

Muscularis Mucosae.—This is well developed and consists of longitudinal bundles of involuntary muscle.

Tunica Propria.—In the tunica propria of the fowl's duodenum there are many wandering lymphocytes. The stroma of the tunica propria is a network of white fibres, among which are numerous muscle cells that are arranged in such a manner that some are found in the central portion of each villus. There are valvulae conniventes present in the duodenum of the fowl as is the case in the small intestine of the mammal. The villi are well developed. They are broad and pyramidal in shape. In the stroma of each villus are many lymphatic cells. Lymph vessels (lacteals) are well marked. Many lymphatic nodes are present in the tunica propria of the duodenum, being arranged in a manner similar to those found in the upper intestinal tract. Between adjacent villi are well-marked crypts of Lieberkuhn. From the bottom of these crypts the glands of Lieberkuhn pass downward towards the muscularis mucosae. The arrangement of these structures is very similar to that occurring in the small intestine of a mammal.

Epithelium.—The interior surface of the duodenum is covered by simple columnar epithelium. Among the columnar cells are found many goblet or mucous cells. This same arrangement is found in the duodenum of mammals.

The glands of Lieberkuhn in the fowl's duodenum are shorter and slightly more coiled than is the case in the mammal. Their epithelium is simple low columnar with goblet cells present. There are no Brunner's glands in the duodenum of the fowl.

Lower Portion of Small Intestine

Serous Coat.—Similar to rest of intestinal tract.

Muscular Coats.—These are arranged in the same manner as are those of the duodenum, viz., an outer and an inner, the last being very well marked.

Submucosa.—Indefinite, there being a narrow zone of white fibrous tissue.

Muscularis Mucosae.—Well marked, being arranged longitudinally. From this muscle layer many fibres pass upwards into the tunica propria as was the case in the duodenum. There are no well-marked valvulae present in the lower small intestine of the fowl.

Tunica Propria.—Similar to that of the duodenum, there being a meshwork of fine fibrous tissue that is closely packed with lymphocytes. Well-marked lacteals are present together with venules and arterioles. In the tunica propria of the villi are many muscle cells.

The lymph nodes, so prominent in the upper end of the small intestine, are fewer in the lower portions of the bowel. There are, however, some scattered masses of lymphoid tissue present in the walls of the lower ileum

The villi in the lower small intestine are broader and shorter than are those higher up in the bowel. Crypts of Lieberkuhn are present, being deep and well marked. From the bottom of each of these crypts opens the short slightly coiled gland.

Epithelium.—Simple columnar with many goblet cells.

The Large Intestine

The large intestine of the domestic fowl differs considerably from that of a mammal, so that biologically it may be said to be more primitive in type. The colon, floating colon, and rectum of the fowl are together about four inches long and are not easily distinguished one from the other, as is the case with the large intestine of the mammal. The diameter of the fowl's large intestine is little greater than is that of the small bowel, there being no well-marked line of division between the ileum and colon. At the junction of the ileum and colon arise two long slender ceca whose diameter is slightly greater than is that of the ileum. They are about seven inches in length being directed back one on each side of the distal end of the ileum to which they are closely attached by a mesentery.

Colon

The Serous Coat of the colon is similar to that of the small intestine.

Muscular Coat.—The usual arrangement as found in the upper intestinal tract is present, there being an outer longitudinal and an inner layer of involuntary muscle, the latter coat being about three times the thickness of the former. Between these muscle coats is a layer of fibrous tissue in which run the myenteric nerves.

Submucosa.—This is a thin layer of white fibrous tissue. There are indistinct valvulae conniventes present in the colon of fowls.

Muscularis Mucosae.—This layer of involuntary muscle is well marked, the muscle cells being arranged longitudinally. From the muscularis mucosae, muscle cells pass upwards into the tunica propria as was the case throughout the small intestine.

Tunica Propria.—Composed of a loose network of white fibrous tissue among which are large numbers of wandering lymphatic cells. There are also present many lymphatic nodules as is the case in the upper alimentary tract of the fowl. In the colon the innermost layers of the mucous membrane are arranged in a manner very similar to that of the same structures in the small intestine, there being villus-like processes present. These, however, are not as well developed nor as long as those of the small intestine. In this particular the mucous membrane in the colon of the fowl differs from that of the mammal, in which case no villi are found.

Glands of the Colon.—Into the interstice between each adjacent villus-like processes open the ducts of several simple, straight tubular glands. These glands are similar to those found in the small intestine. Their epithelium is columnar in type. The fundus of each gland has a wide lumen, while the lumen at the neck of the tubule is very narrow, giving this portion of the gland a duct-like appearance.

Epithelium.—High simple columnar with many replacing cells at basement membrane.

The Cecum

The ceca of the fowl are two long slender blind sacs that open into the upper end of the large colon. Each cecum is about seven inches long. Its diameter is about the same as that of the ileum, to which it is attached.

The following are original drawings of portions of the intestinal tract of the fowl. The various tissues and structures are designated by letters as indicated:

E.—Epithelium.
P.—Peritoneum.

The Serous and Muscular Coats.—These are arranged in the same manner as are the same structures in the other portions of the alimentary tract. The circular muscle of the cecum is well developed.

Submucosa.—This layer is very indefinite, consisting merely of a narrow zone of white fibrous tissue cells. There is an attempt at the formation of valvulae conniventes in the ceca.

Muscularis Mucosae.—In the ceca, as in other parts of the digestive tract, this muscle layer is well developed, being composed of strands or bundles of involuntary muscle, the innermost of which are arranged in a circular manner, the outer fibres being more or less oblique.

Tunica Propria.—This, as is the case in other parts of the intestine, consists of a network of white fibrous tissue among which are muscle cells. The tunica propria of the fowl's cecum contains vast numbers of lymphocytes, together with a few small lymphatic nodes.

Glands of the Cecum.—The mucous membrane of the cecum is thrown into folds which give the structures somewhat the appearance of villi. Into the interstices between the folds open the mouths of numerous short coiled glands whose epithelial cells are smilar to those of the same structures in the colon.

Epithelium.—Simple columnar with scattered goblet cells.

SOME NOTES UPON NEOPLASMS AS THEY ARE OBSERVED TO OCCUR IN DOMESTICATED ANIMALS

By H. E. Batt, B.V.Sc.

The following notes, taken from the records of the Pathological Laboratory of the Ontario Veterinary College, are of some interest as showing that in many cases the varieties of tumors and the ages at which certain new growths occur in the lower animals, coincides with similar conditions in the human being.

It is interesting to note that tumors of the connective tissue type predominate in the specimens examined, and it is considered altogether likely that this form of tumor growth occurs more frequently among the lower animals than do new growths of epithelial origin. This frequency of the occurrence of growths of connective tissue origin may be due in part to the fact that many of our domesticated animals are comparatively short lived and that in many cases they are killed for food purposes shortly before or after maturity. It has long been observed that in the human, malignant growths of epithelial origin occur more frequently in late adult life or during old age, while growths of connective tissue type are mostly met with during youth or young adult life. The reasons why epithelial tumors are more prevalent in older animals, and that connective tissue tumors are more frequently met with in younger animals are not clearly understood, one theory being that the rapid growth of the connective tissues during early life is a possible factor, and that after adult life is reached a more sedentary mode of life with possible abuse of the digestive and other systems is conducive of the production of epithelial new growths. It is a question whether the last has any great influence in the case of the lower animals, except perhaps in the case of old dogs and cats.

The types of new growths met with in the lower animals parallel in a remarkable degree those forms of neoplasms observed in the human being. Their histological characteristics are almost, if not quite, identical. There are

precisely the same modes of growth, and the rules applied to determine whether or not a given tumor is benign or malignant, hold good for both human and lower animals.

Below will be found a table showing the occurrence of both connective tissue and epithelial tumors as applied to the approximate age of the animal in which they were found.

	Connective Tissue Tumors	Epithelial Tumors
In young animals	18	2
In adult animals	15	7
In aged animals	5	10

It will be noticed that the order of occurrence is in each case nearly reversed, and that among the young and adult the connective tissue tumors predominate, while among the adult and aged the majority of tumors are of the epithelial type. It will also be observed that the number of connective tissue tumors outnumber those of eipithelial origin nearly two to one.

As to the variety of tumors occurring among the domesticated animals, the following may be of interest. It will be seen that no one particular kind of tumor afflicts any one species of animal exclusively, and this is constant except in one specific form of a sarcomatous nature, the so-called contagious granuloma only met with in dogs of the bull breeds, and even this particular growth is considered by some authorities as not being strictly a neoplasm.

In cattle.—Were found tumors of the following varieties: fibroma, chondroma, myoma, angioma, lymphosarcoma, sarcoma, papilloma, epithelioma and carcinoma.

In horses.—Firbroma, keloid, sarcoma, adenocarcinoma, carcinoma.

In hogs.—Fibroma, sarcoma.

In dogs.—Chondroma, myoma, keratoma, sarcoma, adenoma and carcinoma.

In cats.—Fibroma, sarcoma, carcinoma.

In rabbits.—Fibroma.

In the domesticated birds our records show that the connective tissue tumors predominate over tumors of epithelial origin in about the same proportion as they do in the mammals, and that, after making allowance for the anatomical and physiological differences that exist between birds and mammals, there is still a great deal of similarity between the new growths occurring in fowl and those which occur in mammals.

The following types of tumors were found in birds: Fibroma, angioma, lymphosarcoma, sarcoma, epithelioma, and carcinoma.

THE DEPARTMENT OF PATHOLOGY AND PARASITOLOGY

The activities of the department can be considered best under the following headings, tutorial, routine, research, and investigatory. Such a division is purely arbitrary and is adopted for purposes of simplicity in making this report.

TUTORIAL.—Lectures and laboratory exercises, which constitute the major portion of the educational work, have been continued as in previous years with but minor modifications. In the instruction of the student, the methods followed are those which tend to stimulate the mind and cause the student to develop his natural resources.

ROUTINE.—The major part of the work of the laboratory consists in the microscopical examination of diseased tissues. This is in order to either establish or confirm a diagnosis. The value of such work to the clinician, and in determining with accuracy the nature of pathological processes, has been demonstrated repeatedly during the year.

Due to an increasing realization of the serious nature of parasitic infestation, both veterinarians and stock men are sending samples of excreta or other material so that the absence or presence of parasites may be determined. This is especially true of those interested in the raising of foxes. Fecal examinations have occasionally revealed serious infections with hook worms (*Uncinaria polaris*). Whenever direct examination fails to reveal the presence of parasitic eggs the method of Vajda is employed, using suitable dilutions of glycerine in accordance with the different ova for which the search is being made. Measurements of the ova of the parasitic worms are being made which should later be serviceable as an aid in diagnosis. Occasionally unknown parasites are received for purposes of identification. In this connection the department is indebted to Dr. R. H. Ransom of the Bureau of Animal Industry, Washington, D.C., for his kind assistance in diagnosing a dog tick, the *Ixodes hexagonus var cookei*, which is very rare in this part of the continent, and also of an unusual nematode of the pheasant, the *Heterakis isolonche*.

Feeding tests are occasionally made of food and water to determine the presence of any substance that might prove toxic to live stock.

The variety and number of pathological tissues examined during the year is recorded in a synoptic table to which the reader is referred. It is gratifying to note that the larger number of specimens received are properly preserved, which greatly enhances the possibility of making a correct diagnosis. Brief reports on a few of the most interesting specimens have been prepared and are included among the appendices.

In the early part of the year the College decided to prepare a suitable vaccine and bacterin for use in the control and prevention of contagious abortion in cattle. The preparation and distribution of this product is now part of the routine work of the department. It is too early as yet to report on the use of these products. Rash conclusions based upon the experience of a few months are worthless. The effect upon a herd must be studied for a long period of time. The demand for these biologics is not as great as had been anticipated, as the product is free of charge to all qualified veterinarians in Ontario

During the six months since the distribution began the following number of doses have been supplied:—

Living organism (Vaccine) 145 doses.

Dead organism (Bacterin) 575 doses.

A prophylactic vaccine to be used as a prevention against joint ill in foals was prepared and distributed to all veterinarians who applied for it, on the condition that a report was made of the results obtained.

Research.—Apart from that which was necessary in conducting the different investigations, little has been done. Some further experiments have been made in the feeding of mouldy sweet clover. A few feeding experiments were also made with rape. The facilities of the department are always at the disposal of all who are entitled to its service.

Investigatory.—As in previous years certain unusual or puzzling outbreaks of disease have been investigated at the request of provincial veterinarians. Reports of this work have been prepared by F. W. Schofield, D.V.Sc., and are submitted as appendices under the following headings:—

Malignant catarrh of cattle.
Broncho-pneumonia in calves and casual infections in cattle.
A note on rape poisoning in cattle.
Acute pulmonary congestion in calves.
Acute alveolar emphysema in calves.
An investigation into an endemic disease of horses.
Cerebro-spinal meningitis in horses.
The inoculation of the pregnant mare to prevent joint ill in the foal.
An unusual new growth.

MALIGNANT CATARRH OF CATTLE

By F. W. Schofield, D.V.Sc.

This investigation was undertaken because of the outbreak of a mysterious disease in a pure-bred herd of Aberdeen-Angus cattle. The local veterinarians were puzzled by the presence of a new disease in their territory, and anxious because of the high mortality. Unfortunately a commercial laboratory had given three different diagnoses on samples of tissue from the dead animals:—anthrax, symptomatic anthrax, and as a last guess—that accommodating disease, haemorrhagic septicaemia.

History of the Outbreak.—The first cases of the disease occurred early in April, when one yearling heifer and one two year old became suddenly sick within a few hours of each other. These animals showed the same symptoms of high temperature (107-108 degrees F.), trembling, muscular twitching, purulent discharge from the eyes, diarrhea which contained blood and mucous, and an entire loss of appetite. The yearling died on the fifth, and the two year old on the fourth day of the disease. Before the death of these animals, the third case of the disease had occurred. It showed similar symptoms except for an absence of diarrhea. This animal which was a two year old died in two days. One week after this last death, a four months' old bull calf became sick and died within a few days. The fifth and sixth cases occurred in mature animals, and with an interval of a few days between the cases. These animals were sick for five and seven days respectively. The seventh case was in a full-grown cow, and occurred about one week after the previous fatality. This was the first case to be seen by the writer. The eighth and last case occurred six weeks later.

Symptoms.—The earliest signs of sickness are a refusal to eat and the presence of muscular tremors which are very pronounced in the region of the thigh. The temperature is high, 106-108 degrees F., the pulse is fast, from 50 to 60 per minute, and the respirations rapid, from 40 to 60 per minute, which make the animal appear to be panting. Auscultation reveals very harsh respira-

tory sounds, but no evidence of consolidation. There is acute congestion of the conjunctiva, and tears trickle over the side of the face. In almost all cases the discharge becomes purulent and the cornea increasingly opaque, so that the animals become blind before death. The nasal mucous membrane is acutely inflamed, which results in a discharge which is at first serous in nature but within a few days becomes muco-purulent, very foetid in odour and contains much fibrin in shreads and small particles. The vaginal mucous membrane was acutely congested. None of the animals exhibited the dullness and stupor which is supposed to be characteristic of malignant catarrh. On the contrary they were quite bright; rather nervous and more difficult to handle than usual. Although the disease is of such short duration the animals lose flesh very rapidly. Death is due to suffocation in some cases, while in others it may be due to toxaemia. In the earliest stages, apart from the serous discharge from the nose and eyes, the disease is lacking in anything definitely characteristic. The animal might be incubating almost any acute general infection.

Post-mortem Examination—Two post-mortem examinations were made. In one case the tissues had become seriously altered due to putrefactive changes so that minor lesions could not be detected.

Case No. 1.—The subcutaneous and muscular tissues were apparently normal. The liver was light in colour but firm. The kidneys and spleen were normal. The large and small intestines both contained one or two areas of acute congestion, but these were localized. Several of the mesenteric lymph glands were acutely inflamed. The great omentum exhibited some rather unusual lesions in the form of tassel-like attachments. There were apparently small areas of edema which had become slightly organized. The interesting changes were found in the thorax. The trachea and all of the bronchial tubes, even to the small bronchioles, were lined with a heavy greenish membrane. This membrane was diphtheritic in nature and possessed of so much fibrin that perfect casts of the bronchial tubes were formed, which could easily be removed by gentle traction. Quite a little membrane with much pus and mucus was loosely attached to the surface of the larynx. The sinuses of the head were inflamed, and there was a marked discharge from the nostrils.

A point of interest is the slight damage suffered by the lung tissue. There were many areas of acute congestion surrounding the bronchial tubes, but nowhere was the lung consolidated. The mediastinal lymph glands were acutely inflamed.

Case No. 2.—Due to advanced putrefaction the examination was not very satisfactory. The mucous membrane of the trachea and larynx was, however, covered with a membranous exudate which also extended into and covered the sinuses of the head. The cause of death was undoubtedly the same in both cases.

Diagnosis.—A definite diagnosis was withheld until after the first post mortem had been made. The post-mortem findings considered with the clinical picture resulted in a diagnosis of Malignant Catarrh.

Source of Infection.—An interesting question, which has as yet not been satisfactorily answered, is:—What was the source of the infection? The disease had not previously occurred in that part of the Province, and no stock had been added to the herd in which the outbreak occurred. After a careful investigation of the food, water, and natural surroundings, two objects came under suspicion. The first was a very unthrifty Holstein cow which, because of a corneal opacity, suggested the possibility of a previous infection. No diagnosis was made of the case and the animal was removed from the herd and slaughtered. It is most

unfortunate that no proper post-mortem examination was made. The other possible source of infection was a most unsanitary barnyard. The yard contained a great deal of decomposing manure and much stagnant water. The disease began to appear very shortly after the herd were turned into the barnyard as a daily routine. The outbreak ceased after both of these possible sources of infection had been eliminated.

Bacteriological Findings.—Direct smears made from the exudate showed the presence of a Gram negative short bacillus, Gram positive cocci, and some diphtheroids. Cultures were made on blood agar plates. Only a few colonies developed, and these were chiefly composed of a very haemolytic diphtheroid. The Gram negative bacillus failed to grow. Some of the membrane was injected subcutaneously into rabbits (2) and in both cases an abscess formed at the site of injection. The abscesses were found to contain a small Gram negative bacillus which was a strict anaerobe. The organism was grown in tissue broth quite easily. Experiments made with the organism are quoted later.

Attempts to Transfer the Disease.—A peculiarity of this disease, which has been long recognized, is the difficulty in reproducing the infection in healthy animals.

Calf.—A healthy calf about two months' old was inoculated by rubbing the ocular and nasal discharges from an acutely sick cow directly into the eye and nose. This was done on two successive days. The calf remained perfectly well.

Fowl.—The disease in the cattle resembled so much avian diphtheria that it was thought advisable to see whether it could be transferred to chickens. Three half-grown birds were used, and the trachea in each bird was swabbed with a suspension of a membrane which had recently been removed from a sick cow. The results were negative.

Guinea Pigs and Rabbits.—Some fresh membrane was rubbed into the conjunctival sac of three guinea pigs and two rabbits with negative results. The nasal passages were also inoculated.

Experiments with the Anaerobic Bacillus.—Four rabbits were infected with this organism by three different methods.

Rabbit No. 1.—A pledget of cotton soaked in a pure culture was placed in the left nostril. A few drops of the culture were introduced into the trachea. On the third day there was a marked purulent discharge from the nostril which continued and increased in volume until the death of the animal which took place thirteen days after the inoculation. The temperature of the rabbit was frequently elevated sometimes as much as 3 degrees F. A post mortem revealed that the needle had failed to enter the trachea so that the culture had been injected into the surrounding tissues. An abscess had formed and the pus following along the trachea had entered the thorax where there was a large abscess involving the anterior lobes of the lung and the pericardial sac. The organism was present in pure culture.

Rabbit No. 2.—A small quantity of the culture was injected into the pleural cavity. The animal showed no very evident symptoms of disease save occasional elevations of temperature (103-105 degrees F.), and accelerated respirations. The rabbit died in twelve days. A post-mortem examination showed empyaemia. The organism was present in pure culture.

Rabbit No. 3.—The left nostril was plugged with a cotton pledget soaked in a culture and both conjunctivae inoculated with the anaerobic organism. The animal was also given 1 c.c. by the mouth. The rabbit remained well.

Rabbit No. 4.—Treated in the same way as No. 3, except no culture given

to drink. The rabbit remained well. The resistance of the last two rabbits can best be accounted for by the fact of their removing the cotton pledgets by sneezing.

The organism is undoubtedly pathogenic for the rabbit. Until the organism has been tested on cattle no pronouncement as to its relationship to malignant catarrh can be made.

Description of the Organism.—A small bacillus with fine body, and varying in size from a small coccus to a delicate bacillus of several microns in length. In staining, the organism is Gram negative.

Remarks.—There is no doubt in the mind of the writer that the disease investigated was malignant catarrh of cattle. Its origin is still a matter of speculation. Some aspects of the disease are worthy of special attention. First, the difficulty of diagnosis in the early stages of the disease. The presence of acute rhinitis, conjunctivitis, and very high temperature are important aids in making a diagnosis. Second, the low grade of infectivity possessed by the disease. The eight cases were spread over a period of almost three months. About one half of the herd were attacked. Third, the malignancy of the infection which resulted in 100 per cent. mortality.

BRONCHO-PNEUMONIA IN CALVES AND CASUAL INFECTIONS IN CATTLE

By F. W. Schofield, D.V.Sc.

These cases were investigated on a farm near Brampton, Ontario. They were all valuable animals, members of a pure-bred herd of Jersey cattle. For many years there has been a high mortality among the Spring and Fall calves, while losses among the cattle occur spasmodically and with a severity that almost indicates the existence of an infectious disease.

History.—Within a period of twenty days three young calves, all under two month's old, had become sick and two of the number had died. They belonged to a group of calves which varied in age from two weeks to two months. Each calf was kept in a separate pen, but the quarters were cramped and contact with the animals on either side, behind or before, was easy. Past records revealed that almost all animals that became sick died, and usually after about ten days of sickness.

Symptoms.—These as related by the attending veterinarian were those of pneumonia, elevated temperature, rapid and laboured respirations with fast pulse. A persistent cough was always present. There was a mucous discharge from the nose. Auscultation revealed moist sounds in the lung. One animal alone was seen by the writer. It was moribund at the time and gasping for breath with shallow and very difficult respirations. The animal was destroyed and a post mortem was held immediately.

Post Mortem.—Two calves were examined and they presented almost identical lesions. The abdominal viscera all appeared normal except the small intestines which were congested in one case and very inflamed in the other. This condition occurred at intervals throughout the small intestine. The lymph glands draining these areas were inflamed. In the thoracic cavity the lung tissue was markedly pathological. The most advanced changes were seen in the anterior lobes. These were solid and pinkish-gray in colour. The surface of the affected lung was somewhat nodular and attached to the chest wall by

a number of bands of fibrin. The lower borders of the remaining lobes were firm and red (red hepatization). The posterior and superior portions of the lobes while slightly congested were quite capable of functioning. After section through a diseased area, pus could easily be expressed from the bronchioles. There were extensive adhesions between the visceral pleura and the pericardial sac. Sub-endocardial haemorrhages were present. The mediastinal lymph glands were acutely inflamed. While the intra-thoracic changes were practically the same in both calves, in one there was a well-marked rhinitis with enlarged and congested regional lymph glands.

Bacteriological Findings.—A direct smear of the pus from each case showed the predominating organism to be a small Gram negative bacillus. A Gram positive diphtheroid was also present in large numbers.

Cultures.—On blood agar with aerobic incubation the small Gram negative organisms failed to develop. The diphtheroid grew well and was haemolytic.

Animal Inoculation.—Two rabbits inoculated subcutaneously with the bronchial discharge developed abscesses which contained a thick creamy-yellow pus. This pus contained almost a pure culture of the small Gram negative and anaerobic bacillus. Cultures were made in fresh tissue broth. The broth cultures when injected produced severe lesions in the rabbit. Three animals were inoculated subcutaneously and in all cases acute inflammation with extensive sloughing and suppuration occurred.

Morphology of Organism.—A small bacillus with slender body and rounded ends. Frequently found in pairs. Some forms resemble small cocci but most are distinctly bacillary.

Cattle Fatalities.—The sudden illness of three valuable animals caused the owner to become alarmed. Two of these animals had recently calved and one was in advanced pregnancy. All of the animals died and were carefully post mortemed. Each was suffering from a different kind of infection. The cause of death in the first was pneumonia. In the second, a general infection which apparently originated in the intestinal tract. The third animal died of septic metritis.

As far as could be ascertained there was no common cause for these infections. Each was an independent and separate infection.

A NOTE ON RAPE POISONING IN CATTLE

By F. W. Schofield, D.V.Sc.

A considerable quantity of rape is grown on the farms which surround the city of Guelph. Being sown late, the rape is usually fed to cattle during October and early in November. Cattle turned into the fields of rape not infrequently suffer from a specific illness known as rape poisoning. This is said never to occur if the cattle are allowed some roughage along with the rape. With an exclusive rape diet the disease quite frequently occurs. The disease has existed for a long time and is not as prevalent now as in former years.

Symptoms.—While these may vary, the characteristic condition is that of rapid, laboured breathing, each expiratory act being accompanied by a grunt. There is no rumination and the peristaltic movements of the bowel are subdued. The rumen is usually well filled with a slop of macerating rape leaves, as the disease does not appear before about one week of exclusive rape diet. In a great many cases subcutaneous emphysema of the cervical, dorsal, and lumbar

regions occurs, and a well marked crackling sound is produced when the hand is passed over the skin in these areas. With restoration of the intestinal activity and evacuation of the contents of the stomach and bowels the animal almost always recovers.

Remarks.—The rapid and very difficult breathing, which is so characteristic of the disease, closely resembles human asthma and is very like the disease described under Acute Pulmonary Emphysema of Calves. It is possible that the disease is a food intoxication due to fermentation and decomposition of the rape which is associated with the atonic condition of the stomach and intestines.

ACUTE PULMONARY CONGESTION IN CALVES

By F. W. Schofield, D.V.Sc.

The investigation was made on a farm near Guelph. The owner had lost three out of six calves within the brief space of a few hours. Assistance in determining the cause of death was sought from the College.

History.—Seven calves varying in age between 10 and 12 months had been pastured on rape for a little less than a month. Following the death of one of these calves, the remainder were removed and put on red clover. After five days on the clover, one of the calves was noticed to be dull and showed little inclination to move. This calf died within twenty-four hours after the first symptoms were seen. Another calf died in a similar sudden manner. The third case followed within a few hours.

Symptoms.—There was a marked stiffness, the animals moving only a few paces after much urging. Respirations were greatly accelerated and the temperature was slightly increased. In one case there was haemorrhage from the nostrils a short time before death. None of the fatal cases were seen by the writer. The remaining three calves when seen appeared to be rather dull. The respirations were increased and the temperature elevated from 1° to 1.5° F. These animals were seen only once, and the report received from the owner was that all were well on the day following the visit. Such a rapid recovery was most surprising. No treatment was prescribed.

Post Mortem.—One animal was examined by the writer and the other two by the attending veterinarian. From his report it would appear that the tissue changes were the same in all cases. The organs of the abdominal cavity were normal in the gross. Marked changes had occurred in the thorax. The lungs were acutely congested, and in some places small areas of the tissue were dark red and almost solid. Occasional subpleural haemorrhages were present. Both parietal and visceral pleura were smeared over with clotted blood. The pericardium was haemorrhagic. The lymph glands were normal. The upper respiratory passages were normal. The post mortem was held under difficult circumstances, being performed in the middle of the night with the illumination of an oil lantern.

Microscopical Examination of the Diseased Tissues.—Examination of stained smears made from the lung tissue revealed no micro-organisms and cultures remained sterile. Both intra-thoracic and subcutaneous inoculations of tissue suspension produced no changes in rabbits. Among the sections of different tissues which were prepared and examined, apart from the lung, the liver alone showed significant changes. Many of the cells were swollen and granular with pyknotic nuclei. There was also much fatty degeneration of

the liver tissue. The changes present were those of a toxic degeneration. The lung sections showed acute congestion with some areas of edema and haemorrhage.

Conclusions.—The absence of bacterial infection, the sudden recovery of the mild cases, coupled with the degenerative changes in the liver, point to a food intoxication. All attempts to discover the ways and means by which the disease was brought about failed.

ACUTE ALVEOLAR EMPHYSEMA IN CALVES

By F. W. Schofield, D.V.Sc.

These cases occurred on a farm near Acton, Ontario. The unusual symptoms presented by the sick calves were thought worthy of investigation by the local veterinarian, H. A. Coxe, who communicated with the College over the matter.

History.—Six calves varying in age from eight to ten months were turned into some old pasture fields on November the 10th. For two days previous to this the calves had been stabled and fed on alsike clover hay. The calves were not seen again until November 15th when they were found in a corner of the pasture field apparently acutely ill. One of these animals died two days later (November 17th), one was killed for experimental purposes, while the others recovered.

Symptoms.—The most pronounced symptom was the accelerated and difficult respirations. The number of respirations varied from 50 to 70 per minute and each expiratory act was accompanied by a loud grunt. The temperature was slightly elevated. The pulse was increased to 60 and 75 beats per minute. Auscultation revealed increased respiratory sounds but no evidence of lung consolidation. The calves were dull, gaunt, and all were constipated. Rumination had ceased and all peristaltic movement markedly subdued. The animals usually chose recumbent positions with their heads drawn around to the side.

Purgatives and stimulants were administered and within a few days the animals began to eat a little, breathe more easily, and except the two fatalities previously mentioned, all made a complete recovery.

Post-mortem Examinations

The first post mortem was made by Dr. Coxe, on the only calf which died from the effects of the disease. He found the liver to be the organ most seriously affected. It was large and friable and contained several haemorrhages. The gall bladder was distended with a thick viscid bile. The abdominal cavity was full of blood, due apparently to a rupture in one of the lobes of the liver.

The second post mortem was made on a calf that had been sick for about one week. The animal was beginning to show signs of improvement when it was killed and a careful post mortem made.

Abdominal Cavity.—The omentum showed a number of circumscribed areas of edema about as large as a five cent piece. These were always located over the terminal branches of a small blood vessel. In the liver the most striking change was to be seen in the acutely inflamed gall bladder. The wall of the bladder was edematous and covered with a network of congested blood capillaries. The contained bile was dark and viscid. There were many contrasts in the liver tissue between the pale areas of degenerate tissue and the dark areas of congestion. Many small haemorrhages could be seen in the capsule. The

spleen was apparently normal. The duodenum was acutely inflamed, and the lumen of the bowel contained some bloody muceous. No other lesions were observed in the intestines. Portions of the abomasum showed acute inflammation. The kidneys appeared normal. Some mesenteric lymph glands were inflamed.

The Thoracic Cavity.—The posterior lobe of the right lung contained a large swelling about as big as a toy balloon. It was resonant and compressible and found to contain air. A ruptured bronchiole was discovered which conveyed the air into the interstitial lung tissue. There was marked congestion around many of the bronchial tubes. All of the thoracic lymph glands were inflamed. No other lesions were found.

Microscopic Pathology

Liver.—The changes were well marked, consisting of areas of fatty degeneration usually associated with haemorrhage. Many cells showed marked atrophy and degeneration due to the acute congestion. Small haemorrhages could be seen in the capsule which was edematous.

Duodenum.—The mucous membrane was badly damaged, the epithelial cells had exfoliated and the tips of the villi frequently showed necrosis.

Lung.—The most apparent change was the marked congestion associated with each bronchial tube. Not only were the small blood vessels of the tunica propria and submucosa acutely congested but the capillaries of the adjacent alveoli were greatly engorged. There was some cellular infiltration with mononuclear cells, chiefly large lymphocytes and quite a sprinkling of eosinophiles. There was marked evidence of acute alveolar emphysema in the numerous ruptured alveoli.

Discussion as to the Nature of the Disease—The absence of demonstrable micro-organisms, the sudden onset of the disease as well as the fact of every calf in the group being simultaneously affected, would indicate that the disease was not due to a living cause. How to account for the very characteristic symptom of asthmatic breathing is the problem. The pastures were thoroughly searched for some toxic plant but nothing harmful could be discovered. In the opinion of the writer the disease is produced by the formation of toxic substances from the food after ingestion. This idea is strengthened by the great similarity between this condition and one mentioned in another appendix due to the eating of rape or turnip leaves.

AN INVESTIGATION INTO AN ENDEMIC DISEASE OF HORSES

(Occurring chiefly in Kent and Essex Counties of the Province of Ontario)

By F. W. Schofield, D.V.Sc.

Introduction.—The disease considered in this report was brought to the attention of the College by Dr. Chas. Boyd, of Harrow, Ontario. Due to the seriousness of the outbreak, which seemed to be assuming the proportions of an epidemic, aid from the College was asked for. The investigation was begun on July 30th, 1924.

Historical Note.—This disease of horses is known locally by the name "cholera", and has existed in parts of Kent and Essex Counties for nearly half a century. Some of the oldest inhabitants said that as far back as they could remember the disease had existed in that part of the country. Scarcely a year

passes without the occurrence of the disease, sometimes in a very acute form with high mortality; in other seasons the infection is not severe but the number of cases unusually large. The farmers in the affected areas consider the disease as very serious due to its constant occurrence in the haying season, the lack of any remedy to either control or cure the disease, and the occasional high mortality.

There can be no doubt as to the need of a careful investigation. Both veterinary surgeons and laymen have given a great deal of attention to the disease, but as yet the cause is unknown, the nature of the disease but partially understood, and no very satisfactory method of treatment discovered.

Map of the Counties of Essex and Kent.

The dotted areas indicate the chief centres of the disease affecting horses.

Distribution of the Disease.—As previously stated, the disease appears to be confined to the most southern part of the Province, namely Kent and Essex Counties. This part of the Province is a peninsula, being bounded on the north by Lake St. Clair, on the west by the Detroit River, and on the south and east by Lake Erie. There is a definite relationship between the water front and the occurrence of the disease. For example, the disease is almost unknown in the country surrounding the Town of Essex, which is one of the farthest inland points in the peninsula. Possibly the most seriously infected areas lie between the towns of Amherstburg and Harrow in the south, and around Mitchel Bay in the north. In general one might say that the zone of infection extends from the water front to a distance of about five miles inland. An interesting fact is that the disease rarely occurs in horses that are living in the towns of the infected zone. For example, during the last ten years one or two cases only have occurred in the town of Amherstburg while in the surrounding territory there have been several hundred cases.

Prevalence and Mortality.—It is impossible to obtain reliable information as to the number of cases that have occurred even in recent years. The last severe epidemic was said to have been in the year 1916. During the month of July of the present year (1924) there was an extensive and serious outbreak of about one hundred and thirty cases, with twenty-two deaths. There was a marked difference in respect to the mortality, some veterinary surgeons reporting a mortality of less than 1 per cent. while others had a mortality as high as 33 per cent.

Description of the Disease.—While the severity and sometimes even the symptoms of the disease are modified from year to year, the most constant characteristic is the acute diarrhea accompanied by marked depression. Because of this, the names "horse cholera," "dysentery," "abdominal typhoid," are all used to describe the disease.

Symptoms.—In the *acute form* the disease is ushered in by dullness and marked prostration. The animal stands with the head hanging, the ears lopped, and refuses all food. When made to walk the gait is uncertain or even staggering. The animal appears to be very toxic. The mucous membrane of the eye is injected and of a dirty brownish-red colour. All visible mucosae are injected. The surface temperature is very variable. The limbs are cold constantly, while the back and buttocks may be either cold or hot. Peristalsis is usually very active with loud rumbling and gurgling sounds which may sometimes be heard at quite a distance. The temperature is raised from 1° F. to 4° F. The pulse is full and firm and running at from 70 to 90 beats per minute. Palpitation of the heart is not uncommon. The breathing is always accelerated and is markedly abdominal. Diarrhea almost always occurs quite early in the disease, and is looked upon as a favourable symptom. When diarrhea is absent or only slight the disease is called "dry cholera" by the farmers, and all agree that this form of the disease is very serious, the "wet cholera" being much more favourably regarded. The bowel movements may become very frequent and the feces like turbid brown water. Small quantities of mucus may be seen, but no false membranes are passed. The feces usually have a disagreeable acid odour, which is rather characteristic.

In the *mild form* the symptoms already mentioned may be present but to a less degree. Very frequently the disease is overlooked till the animal begins to scour. The diarrhea lasts for a few days, but is unaccompanied by any severe depression or marked constitutional disorder. The animal soon comes back to its feed and there is only slight loss of condition. An interesting feature of the disease is the absence of pain. The animals practically never show evidence of acute pain and rarely of milder colicky pains. This is certainly unusual in diseases of the intestine, especially in the horse.

Duration and Progress.—The crisis occurs about the fourth or fifth day of the disease. When mild the temperature drops to normal, the appetite returns and the animal quickly recovers. In the acute form the temperature remains elevated. The diarrhea may become more pronounced or be followed by an obstinate constipation. The animal refuses to eat, appears very depressed and rapidly loses flesh. There is little or no evidence of abdominal pain, but the animal frequently moves from foot to foot, apparently to relieve the aching joints. The respirations become more frequent and shallow, the pulse fast and weak, the lungs begin to fill and the animal lies down a short while before it expires with little or no struggling. Death usually occurs in from seven to ten days after the onset of the disease. Laminitis is a common sequel in both the acute and mild form of the disease.

Post-mortem Appearance.—Two cases were autopsied by the writer which will be described separately. Another case autopsied by Dr. Boyd revealed similar conditions.

Case 1 (Mr. B.)—Brief Clinical History.—The mare had been "off colour" for two days before she entirely refused food on July 16th. Being constipated the owner gave her two pints of castor oil on the 17th. The following day the mare was purging freely. For the next few days there was acute diarrhea. This was finally controlled but the temperature remained elevated, 103° to 105° F., and the mare refused to eat and lost flesh rapidly. She died on July 24th on the eighth day of the disease.

Post Mortem.—On removing the skin a marked congestion of the subcutaneous capillaries was noticed. The blood had not coagulated and was very thick and dark. The skeletal muscles were distinctly lighter in colour than normal. On opening the peritoneal cavity the fat traversed was of a dirty brown colour. The cecum and great colon were lightly attached to the abdominal wall and in many places by a fibrinous exudate. There was no fluid in the cavity, in fact the viscera had a markedly dry appearance. The cecum contained quite a little foetid fluid, in which was floating particles of hay and grain. The mucous membrane was acutely inflamed being a dark red, almost purple colour. Portions of the large colon and floating colon were similarly inflamed. The small intestine showed an inflammation of equal severity involving the mucous membrane of the duodenum and many areas in the jejunum and ileum. That the inflammatory reaction was not entirely limited to the mucosa was evident by the presence of a fibrinous exudate on the peritoneal surface of the bowel. The intestine was friable and easily torn. The lumen of the intestine contained a small quantity of a chocolate-coloured slime in those areas where the inflammation was pronounced. The liver was light in colour and friable. The spleen appeared somewhat shrunken and numerous petechiae could be seen in the capsule. The mesenteric lymph glands were dark red in colour and edematous. The kidneys were definitely congested. In the pectoral cavity, the lungs were congested, being filled with blood which was dark and tarry. The heart muscle was light in colour having the appearance of boiled beef, in the absence of sheen and the ease with which the bundles of fibres could be separated.

The appearance of the cadaver would strongly indicate the presence of an acute general infection.

Case 2 (St. O.)—Brief Clinical History.—This was rather difficult to obtain as several people had attended the case. The illness began with diarrhea which continued for three days. This was followed by obstinate constipation. Oil had been given in large quantities with rather indifferent results. When seen by the writer some thirty-six hours before death, there had been no movement of the bowels for five days. The animal was very weak, the breathing was rapid and abdominal, the pulse almost imperceptible, and the temperature subnormal. The horse died on the fifteenth day of the disease.

Post Mortem.—On removing the skin the engorged condition of the minute blood vessels was very apparent. The blood had not coagulated and rigor mortis was absent, the animal having died some three hours previously. There were quite a number of haemorrhages in the subperitoneal fat. The peritoneal cavity contained only a little fluid, but there were numerous adhesions between the different loops of intestine and also between the visceral and the parietal portions of the peritoneum. Almost the whole surface of the peritoneum covering the cecum was rough and dull due to the presence of fibrinous exudate.

The mucous membrane of the duodenum was swollen and inflamed. Throughout the length of the small intestine there were numerous large and small areas of catarrhal inflammation. Much of the mucous membrane of the cecum and large intestine was similarly inflamed. In the cecum the submucosa was infiltrated with a blood-stained serous fluid. The whole of the intestinal canal did not contain more than about a pail of very watery feces. There was no obstruction although the bowels had not moved for six days. The stomach appeared normal. The spleen seemed shrunken, and in the capsule were numerous minute haemorrhages. The liver was very large, light yellow in colour, friable, and the capsule stripped easily. There were many soft fibrinous bands on the surface. The kidneys were swollen and had a mottled appearance on section. The urinary bladder was empty, the mucous membrane was congested. The mesenteric lymph glands were dark red or even purple in colour. Examining the pectoral cavity, the lungs were found to be congested. The heart showed several ecchymoses under both the endocardium and pericardium. The muscle was light in colour and only a few areas of normal heart muscle remained. As in the previous post mortem the appearance of the tissues would indicate a general infection.

In the autopsy made by Dr. Boyd, the pathological conditions closely resembled those recorded above. The heart, however, was more severely damaged, there being evidence of an inflammation of the myocardium. The stomach showed no evidence of inflammation, but both large and small intestines showed acute and extensive inflammation of the mucous membrane.

Etiology.—Naturally the discovery of the cause of the disease was one of the most important objectives of the investigation. At the present, although some of the supposed causes have been eliminated, the exciting factor of this disease remains unknown.

As would be expected, both laymen and veterinarians who live in the infected area have their own ideas—very definite ones sometimes—as to the cause and nature of the disease. The most important of these will now be considered.

The May Fly (*Ephemerida*).—Synonyms, the June Fly, the Fish Fly. This ephemeral insect is found in unusual numbers in the district where the disease is most prevalent. The flies breed in the lake and river and when the wind is off the water they are carried over the land like swarms of locusts. They are seen piled up inches deep under the electric lights, and may be so thick in the pasture that it is impossible to walk without treading on numbers of them. Now, the strange thing is that the disease always appears a few days after the May flies appear, and is at its worst by the time the May flies disappear. The flies do not usually last longer than a month, from the first week in July to the first week in August. Unquestionably the most popular belief as to the cause of "horse cholera" is the "May fly theory." No one knows how the May fly causes so serious a malady, but most are quite sure that it does.

The chief objection to the "May fly theory" is that the May fly occurs in many parts of Ontario where the disease is unknown. Also cases of this disease have occurred long after the May fly has disappeared. Other cases have occurred in horses that were kept in the stall.

In favour of the "May fly theory," one must point out that the flies are more prevalent along the water front than inland. The flies, like the disease, decrease as the distance from the water increases. Some experiments have already been made with May flies, but more must be undertaken before such a popular theory is discarded. It may be mentioned in passing, that thus far

the only factor common to all cases is the May fly. However, the number of flies ingested by stabled horses must have been small.

The experiments that have been conducted with the May fly are mentioned in another section of this report.

New Hay.—Many farmers are of the opinion that new hay is the cause of the complaint. It is well known that new hay is sometimes provocative of severe diarrhea in the horse. In favour of the theory is the fact that the disease rarely appears before haying and is at its worst during the haying season. Much evidence can be brought against such an idea. For instance, many authentic cases have occurred while the horses were out at pasture. Other cases have occurred in horses that were being stabled and fed old hay. If the disease were due to the feeding of new hay, it would be hard to account for its endemic occurrence.

Poisonous Plants.—This suggestion was carefully considered and some of the pastures examined for toxic foliage, but none could be found. The fact that convalescent horses may be turned into the pastures in which they were grazing when attacked by the disease, without any recurrence of the malady, is very strong evidence against the poisonous plant theory.

Miasm and Stagnant Water.—It was only natural that the venerated idea of "pathogenic night mists" would have been applied to this disease which occurred with such frequency in the neighbourhood of lakes, rivers, and marshes. There seemed to be no relationship whatever between the sanitary quality of the water supply and the disease. Many cases had occurred where the water was coming from the safest of deep driven wells.

Is the Disease Microbial in Origin?—After carefully considering all the available evidence, the suspicion that the disease is due to microbial infection strengthens into conviction. Although blood and feces and tissue have been examined without the isolation of any constant bacterial species, yet there are some formidable reasons for considering the disease as being due to infection. First:—The clinical picture is suggestive of infection. The elevated temperature, fast pulse, and increased respirations, with the marked depression. Second:—The pathological changes which are seen in the tissues are certainly such as are commonly seen in acute infections. Third:—The fact that one attack almost always confers a lasting immunity. One must not overlook the possibility of microbic growth in the pasture. Many farmers stated with emphasis that the disease only occurred when the days were very hot and the nights unusually cold, conditions that would be suitable for the growth of moulds or other fungi. Also a heavy rain is supposed to check the disease. At present it has been impossible to associate the disease with any particular kind of soil, or with changes in the rainfall and temperature.

Morbid Histology.—The findings recorded here are based upon a microscopical examination of tissues taken from three fatal cases of the disease.

The Small Intestine.—The more superficially placed epithelial cells have been entirely removed. Even the deeper cells of the crypts frequently show signs of degeneration, and separation from the basement membrane. The capillaries of the villi are distended with blood, small haemorrhages are frequent. Numerous cells have infiltrated the area, chiefly large and small lymphocytes and plasma cells. The polymorph is not common. The blood vessels of the submucosa are very congested and blood pigment is commonly seen both within and without the vessels. Small crystals of lime salts are present in the intima of the larger arteries. The muscle fibres, both circular and longitudinal, show marked evidence of degeneration in the granular and poorly stained fibres.

The connective tissue is edematous and in places noticeably infiltrated with wandering cells. The overlying peritoneum is swollen while the capillaries are all engorged.

The Large Intestine and Cecum.—The changes here are identical with those described above, being modified only by the different histological structure of the parts.

The Liver.—Fatty degeneration, cloudy swelling, and in some areas a loss of alignment of the cells. Many areas of congestion are found.

The Spleen.—An increase in blood pigment, which is contained in large phagocytic cells.

The Kidney.—Cloudy swelling and necrosis of the epithelium of the convoluted tubules. Many of the cells have separated from the basement membrane. The capillaries are engorged with blood, and granules of blood pigment are everywhere found between the cells. The kidney tissue has been badly damaged.

The Heart—In one case the muscle fibre has in some areas undergone degeneration and necrosis, due to a myocarditis. In one of the two other cases there is a pronounced congestion of the capillaries. In both there is evidence of albuminous degeneration.

Bacteriology.—Numerous cultures have been made from the blood, excreta, and diseased tissues of affected animals, but up to the present without success in the isolation of anything specific. Agglutination tests were made on a number (seven) of the isolated organisms, but no reactions that could be considered specific were obtained.

It is of interest to note that in three out of six samples of feces examined, a streptococcus was in the ascendency the colon bacillus being greatly outnumbered by this organism. In the future, if satisfactory results are to be obtained, the specimens for bacteriological examination must reach the laboratory in one or two hours instead of in one or two days.

Blood Examination.—Blood films were prepared from six cases of the disease, and after staining with Wright's stain examined. In all cases the blood appeared to be normal.

A count of the white blood cells was made in one case only. The sample taken during the acute stage of the disease gave a count of 8,000 per c.mm. The count made during convalesence was 8,100 per c.mm.

Epidemiology.—The evidence acquired from a study of the outbreak would indicate that the cases did not develop from one common source of infection. Neither was there much evidence to show that the disease spread from one sick animal to another. The cases seemed to occur spontaneously and without regard to pre-existing cases. For example, the first case occurred on July 14th, the second case on July 15th, and the third and fourth cases on July 16th and 17th respectively. Here we have four cases occurring on four different farms during four days. Although the first two cases developed on adjoining farms there was no known contact, and twenty-four hours is an insufficient incubation period. It is most unlikely that any of these cases were responsible for a secondary case. With regard to case number four, this animal was separated from the other case by a distance of several miles. The disease is not easily transmitted from animal to animal, otherwise long ago it would have ceased to be an endemic disease. Also it is unusual for more than one case to occur in the same stable. In the Harrow district there were fifteen cases occurring on thirteen different farms. In two instances there were two cases on the same farm.

This and other evidence points to either multiple sources of infection, possibly each farm possessing its own focus of infection, or a common source of infection which is distributed by insects or some other carrier of disease.

It will be noticed that the writer has based the above discussion and conclusions on the assumption that the disease is due to a micro-organism.

Animal Experiments.—A number of experiments have been conducted to determine whether the disease was transmissible to animals of the same species and to animals of another species. If the transmissibility of the disease could be proven then a living cause could with certainty be postulated for the disease. The experiments came to a sudden conclusion due to the rapid decline and termination of the endemic. It was very difficult to secure horses with a guarantee that they had never either suffered from or been exposed to the disease.

(*a*)—*To Determine whether the Disease is Transmissible from Horse to Horse.*—Two horses were drenched with about a quart of feces made by mixing the diarrheal stools from three well-marked cases of the disease. About 60 c.c. of citrated blood was also given intravenously. The blood had been drawn from three acute cases and mixed in equal proportions.

On the sixth day of the experiment one of the two horses came down with what the attendant, Dr. Boyd, considered a typical but mild form of the disease. The animal refused food, purged for two days, had a rise of temperature to 104° F., pulse increased to 60, while the respirations were accelerated to 60 per minute. The animal recovered, but remained weak for some time. The other horse showed no evidence of sickness throughout the experiment.

Further experiments must be undertaken before any conclusions can be made. Also whether the blood or the feces contains the exciting cause must be decided.

(*b*)—*To Determine whether the Disease can be Produced by the Ingestion of the May Flies.*—Two horses were drenched with a suspension of ground May flies. It was unfortunate that live flies could not be obtained for the experiment, but the work was commenced at too late a date for this to be possible. The material used consisted chiefly of the moultings rather than the bodies of dead, yet mature flies. The moults of several hundred flies with many dead flies were given to each animal, but with no untoward effect. Further experiments in the transmission of the disease must be made before the cause can be definitely determined.

Experiments with Small Animals

Experiment 1.—Four rabbits were injected intravenously with citrated blood (4.0 c.c.) from acute cases of the disease. Two of these rabbits died within a week after the injection. In both cases the post mortem revealed impaction in the large intestine, with localized peritonitis. Feces from the two dead rabbits was fed to two healthy rabbits. The latter remained perfectly well.

Experiment 2.—Three guinea pigs were fed with large quantities of the dead May fly. As before stated the mixture chiefly consisted of the moults of maturing flies and the carcasses of dead ones that had been collected from the vicinity of electric lights. One guinea pig died five days after the feeding and a post mortem revealed the following:—Catarrhal inflammation of the small intestine; marked congestion of the venous plexus in the globus major of the epididymis, which extended into the spermatic cord. The sublumbar, the iliac, and the axillary lymph glands were all edematous and blood stained.

A healthy guinea pig was fed with feces from the above dead pig, and died seven days later, showing identical lesions, with the addition that the gall bladder was markedly inflamed. Further transfers of the disease were attempted, but resulted in failure. Bacterial cultures were made from the feces and tissues of both of the above-mentioned guinea pigs, but no specific organism was isolated. The intestinal mucous contained large numbers of an ameboid organism. No such organism was found in the feces of diseased horses.

This peculiar condition of the guinea pig has been recorded, because of its definite features and its occurrence in several animals.

Experiment 3.—Eight guinea pigs and three rabbits were fed on samples of feces from typical cases of "horse cholera." Two of the guinea pigs died, one four and the other five days after the ingestion of the feces. The conditions found on post mortem resembled very closely those seen in the guinea pigs which had consumed the flies. Attempts to transfer the disease to healthy pigs were futile. One of the three rabbits died, showing some intestinal inflammation but like the condition in the guinea pigs, it resisted transference to another animal.

At the present the experimental work with animals has been productive of no definite results. Many more experiments must be undertaken and under more suitable conditions. A long railway journey in very hot weather, with change of food and a delay of many hours in shipping may have been in part responsible for the disease and death among the guinea pigs.

Prophylaxis and Treatment.—While darkness and mystery continue to obscure the nature of the disease, prophylactic measures are purely empirical. After going over the disease-infested territory and discovering that the treatment which is a sure cure in the hands of one veterinarian is the very treatment that the next veterinarian affirms will kill every horse it is tried on, one is diffident in prescribing or even suggesting suitable remedies. The only prophylactic measure that one can advise would be the stabling of the horses and feeding on old hay during the dangerous period from the middle of July to the beginning of August. It is certain that stabled horses on hard feed are not as susceptible as horses running at pasture.

In regard to treatment this must vary according to the different symptoms present. The inflamed condition of the intestinal mucous membrane must be borne in mind. Also the tendency to superpurgation and cardiac weakness. Drastic purgatives are entirely out of the question; castor oil with the use of high enemata should be relied upon to overcome the frequent early and late constipation. Parched flour is good to check the diarrhea, but when severe and continued opium will most likely have to be used. Stimulants, including strychnine and digitalis, must be given in accordance with the general depression and the condition of the heart. Linseed tea, oatmeal water and gruel are valuable foods. The animal should be coaxed back to its food by tasty morsels of green corn or other green food. Small quantities only of luke warm water should be given. The surface chilling of the body can be overcome by hand rubbing or whisping, and suitable blanketing.

Conclusions.—The only conclusion which the writer feels justified in making is, that the disease investigated and popularly known as "horse cholera" is "*Acute Intestinal Catarrh.*" It differs from the ordinary forms of intestinal catarrh in being endemic, having a high mortality, and producing great depression which is unaccompanied by severe pain, in the animals attacked.

CEREBRO-SPINAL MENINGITIS IN HORSES

By F. W. Schofield, D.V.Sc.

This investigation was conducted on a farm near Port Hope, Ontario. Several horses belonging to a local farmer were reported as having died and the remainder were very sick, so help from the College was requested by the veterinarian in charge, Dr. J. N. Johnston.

History of the Outbreak.—The first indication of ill health among the horses occurred on Saturday, November 30th, 1923, when one of two horses that were drawing a plough seemed to be very languid and lay down while at work. The horse was not very sick, but seemed drowsy and tired. On the following morning, December 1st, when the owner entered the barn he found three horses lying down in their stalls and in a very serious condition. These animals all died within twenty-four hours. Early the following morning three more horses were found in a similar condition. Two of these horses died the same day, and one on the following day. The remaining four horses came down with the disease, one of which died.

Symptoms.—All cases showed the same symptoms, the only difference being in the intensity of their manifestation. The animals lay down most of the time, and when raised could only walk for a short distance with an unsteady, staggering gait. This inco-ordination of movement was apparently of nervous origin, as there was more or less paralysis of the pharynx and tongue in all cases. Violent struggling frequently occurred; at times the animal becoming almost maniacal and then returning to a semi-comatose condition. There was no rise of temperature, the respirations were increased and the pulse very fast and weak. Most of the horses died within forty-eight hours and while struggling.

Several post-mortem examinations were made, by the attending and also by consulting veterinarians, but nothing of significance could be found.

Personal Observations.—When seen by the writer on December 4th, three of the four remaining horses seemed on the way to recovery; the fourth was in a very serious condition, due to mechanical pneumonia. It died on the following day. None of the animals examined had a temperature. The pulse was slightly accelerated and easily compressible. They all appeared weak, and when walked still showed some inco-ordination of movement. In two cases there was still difficulty in swallowing, so that when drinking some of the water was returned via the nose. Each animal was given 90 c.c. of Botulinus antitoxin intravenously. Nourishing and laxative food was also advised. These three horses all made a good recovery. An exhaustive investigation of the food and water supply revealed the fact that some musty oats had been fed to the horses at the time of the outbreak.

THE INOCULATION OF THE PREGNANT MARE TO PREVENT JOINT ILL IN THE FOAL

By F. W. Schofield, D.V.Sc.

In a previous report made to the Department of Agriculture on the disease, Joint Ill, the suggestion was made that the foal might be protected by the immunization of the dam at a suitable time before parturition. During recent years this practice has come in vogue and is being followed by quite a few veter-

inarians. It was thought that if sufficient bacterin could be distributed an experiment of some magnitude could be made from which reliable conclusions could be formed. This, however, has not been accomplished. In the first place there was not a very heavy demand for the bacterin; secondly, the reports obtained are meagre and not unanimous. The available results together with an outline of the work are now recorded.

Preparation of the Bacterin.—Organisms used: Seven different strains of streptococci were used in the bacterin. No other organisms apart from pyogenic streptococci were used. Most of those who have investigated the disease are agreed that pyogenic streptococci greatly predominate in the infection. Streptococci vary so much in virulence that a test was made of all the strains used in the production of the bacterin, and only virulent strains employed. The streptococci were grown on serum agar slants, and those which killed rabbits, accompanied by marked haemolysis, were chosen. The quantity injected was the twenty-four-hour growth on a serum agar slant; the rabbits used weighed about two and a half pounds and the proper time required to kill was considered as between thirty-six to forty-eight hours. The streptococci had been isolated either from cases of joint ill or from acute pus infections in the horse. The dosage used was large, and was determined by the local and general reaction produced by the injection of different quantities into some valueless test horses. A well marked local and slight general reaction were required.

Administration.—Whenever possible two injections were made into the pregnant mare at an interval of one week. The injections were to be arranged so that the second dose was given from five to seven days prior to parturition.

Results.—These are not very encouraging. Out of twenty veterinarians who were supplied with the treatment only eleven have turned in reports. A synopsis of these reports show that a total of twenty-six mares were treated in twelve different districts of the Province, with four cases of joint ill developing after the treatment. In twelve cases the mares had given birth to diseased foals in previous years. In the present year with the prophylactic, these twelve mares have raised ten healthy foals, as one of the two which became infected developed the disease in mild form only and recovered. The other foal showed typical symptoms within twenty-four hours and died. The other fourteen mares, about which information as to previous diseased offspring is lacking, have raised twelve healthy foals. Of the two which developed the disease, one is known to have died; information on the other is lacking.

The following comments are made on the experiment:—

1. The limited number of cases make reliable conclusions impossible.
2. In judging the results it is important to remember—(a) that the treatment was used in seriously infected districts; (b) that the bacterin was not of mixed infection, but contained varieties of streptococci only.
3. These results would substantiate the growing belief that such a bacterin is of real value, although not an absolute specific. Its use is rational and should be recommended in conjunction with the usual hygienic measures employed.

Note.—Some veterinarians claim 100 per cent. protection of the foal by the immunization of the dam with polyvalent mixed infection bacterin. Inoculation of the foal at time of birth is of value, but should not be substituted for inoculation of the dam.

AN UNUSUAL NEW GROWTH (CYLINDROMA)

By F. W. Schofield, D.V.Sc.

A brief report is made because of the scarcity of this kind of tumor. The name of cylindroma is unfortunate, because it has no relationship to the histogenesis of the tumor cell, but is derived from the peculiar shape of the essential element of which the tumor is composed. The cylindromata are tumors in which hyaline cylindrical strands and masses abound and predominate over the other elements in the tissue. Small spindle-shaped nuclei can usually be seen along the margin of these hyaline masses.

History of Case.—A bay mare, aged about fourteen years and in good condition, was noticed by the owner to be developing a peculiar nodular thickening of the skin in the region of the poll. There was no history of injury. Slowly the nodular thickening increased and spread to the ears. Cutaneous thickenings could easily be felt by passing the hand down the neck in the direction of the shoulder.

Ante-mortem Examination.—The owner stated that the condition had existed for about six months and was slowly becoming worse. In the region of the poll there was a diffuse and nodular thickening which was apparently in the skin. The nodules were about as large as a twenty-five cent piece, and were very firm. A number of small elevations of the skin could be felt on the side of the neck, and a few in the skin over the chest. Both ears were thickened to almost twice the normal diameter. The submaxillary and prepectoral lymph-glands were greatly enlarged. The animal was killed and a post-mortem made.

Gross Appearance.—A cross section of the nodules showed these to be thickenings of the corium. The tissue was infiltrated with a translucent substance which was firm in texture and pale yellow in colour. The submaxillary, prepectoral and mediastinal lymph glands were greatly enlarged and entirely transformed into masses of a peculiar, yellowish, homogenous, structureless substance, which had the brittle texture and much the colour of a piece of raw potato.

Microscopic Appearance.—Sections from the cutaneous lesions showed the presence of numerous cylindrical strands and small masses of a hyaline-like material which stained intensely red with eosin. In a great many instances the first appearance of the hyaline was in the walls of the small blood vessels. In numerous other cases small masses of hyaline seemed to be built around a central cylinder which possessed a small lumen. Sections made from the lymph glands showed a few scattered areas of lymphatic tissue between great masses of the hyaline material. The cylinders and strands of hyaline were quite massive. The picture in many ways resembled closely a keloid. Small, spindle-shaped nuclei were constantly present along the borders of the masses.

It is interesting to note the metastasis of this tumor, and that the malignancy was due to the hyaline producing cell, as the secondary growths were composed almost entirely of this cell.

Thanks are due to Dr. Klotz, Professor of Pathology, Toronto University, for making the diagnosis.

DEPARTMENT OF BACTERIOLOGY

The work of this department may for convenience be considered under the following divisions:—

TUTORIAL.—This consisted of the regular class lectures and laboratory instruction to the students as set forth in the curriculum for the session.

RESEARCH AND INVESTIGATIONAL.—Arrangements were made whereby Dr. Ronald Gwatkin of this department was able to devote considerable time to researches and investigations relating to diseases of poultry as well as routine poultry work. To meet a popular demand Bulletin 305, on Diseases of Poultry, was published and has been of considerable service in supplying desired information in a convenient form when required as auxiliary correspondence. On account of the number of routine specimens to be examined and reported upon, it was not possible to devote as much time to the experimental work as desired. A number of special visits of investigation to the premises of several large poultry breeders had to be made. As a result three hundred cases were received at the College for treatment and about fifteen hundred supervised at outside points. The experimental work was carried out with avian diphtheria, roup, fowl cholera, bacillary white diarrhea, blackhead, vent gleet, parasites, deficiency conditions, and others. Some of the work undertaken was carried to a point where information can be gained from it, while other experiments have not advanced sufficiently to warrant definite conclusions. These experiments are fully described in a series of articles by Ronald Gwatkin, D.V.Sc., and are embodied in the report as appendices under the following titles:—

Some notes on avian diphtheria (chicken-pox).

Contagious nasal catarrh in fowl (roup).

Vent gleet (cloacitis).

Edema of the wattles.

Bacillary white diarrhea in chicks and *Salmonella pullora* infection in adult fowls.

Fowl cholera.

PREPARATION OF BIOLOGICAL PRODUCTS.—The preparation of these products has been undertaken to determine the probable value of certain biologics for the preventive and curative treatment of some infectious diseases of poultry. During the winter months two thousand doses of chicken-pox vaccine and twelve hundred doses of fowl cholera bacterin were prepared for use.

ROUTINE.—A large amount of routine work has been done, consisting chiefly of the serological examination of blood samples and the bacteriological examination of other specimens. All specimens sent to the College are immediately examined and reports of the findings are furnished those concerned as quickly as possible. It is of interest to mention that two cases of anthrax were diagnosed through the laboratories of the College and reported to the Health of Animals Branch. The following is a summary of specimens examined:

Blood Serum Examinations

Animal	Disease	No. of Samples Tested	Positive	Doubtful	Negative
Cattle.....	Infectious Abortion...	258	109	31	118
Poultry.....	Pullorum Infection...	880	95	5	780
	Total.....	1,138	204	36	898

SOME NOTES ON AVIAN DIPHTHERIA (CHICKEN-POX)

By Ronald Gwatkin, D.V.Sc.

During the past winter experiments were carried out with avian diphtheria in regard to etiology, control and treatment, especially by vaccination.

Outbreaks of a respiratory infection occur in fowls in Ontario in which no chicken-pox lesions are seen, nor the typical yellow exudate of diphtheria. This experimental work was done to see if the condition was caused by the same virus, for confirmation of the filterability of the causative agent of diphtheria, and for information regarding the value of vaccination in control and treatment of the disease.

Avian diphtheria or chicken-pox is reported to occur in three forms. A pure mucous membrane disease; a pure skin disease; and a combination of skin and mucous membrane infection. The most common in Ontario seems to be the pure mucous membrane form and then the mixed type. The mucous membrane infection appears in two rather distinct varieties. A very acute form, in which the trachea fills with a sticky, bloody exudate and clots of blood, and in which no yellowish cheesy matter collects in the mouth and larynx. This is the form that has caused such heavy losses at, or after, poultry shows. It has been called among other names, influenza, and was apparently not recognized as diphtheria by poultrymen, owing to the absence of typical lesions. The other mucous membrane form is generally less acute; yellow cheesy masses forming in the mouth, larynx, eyes, and trachea.

Symptoms.—The disease commences like a cold or roup. There is dullness, fever, sneezing. The eyes water, and occasionally they swell and the lids become stuck together. The suborbital sinuses may swell, as in roup. Birds become very mopish and quite indifferent to their surroundings. A bad smell is not always observed, but is present in some cases. Diarrhea is commonly present. Breathing is difficult, and bubbling noises are heard, due to exudate in the trachea. There may be nasal discharge, though this is frequently slight or absent. Yellow, cheesy patches may be found in the mouth and larynx, and on the tongue. In many cases these patches are not seen. There may be an eruption on the comb and wattles of some of the birds, yellowish at first, becoming dark brown or black. On the other hand, no chicken-pox scabs may be seen on any of the birds during an outbreak. In the California Agricultural Experiment Station Report for 1921-22 it is noted that Carpenter found fifty fowls in a flock of three thousand showing chicken-pox lesions of the skin of the breast region without involvement of the head. Such a proportion is unusual. Baby chicks may be affected on the body, and infection of the feet has occurred from marking with a punch.

Period of incubation and duration.—These are variable. Symptoms may appear as soon as three days after exposure to infection, or as late as two weeks. In fatal cases birds may die within a day or two after the appearance of symptoms, or may live for a week or ten days. Recovery takes place in from ten days to three weeks. Some cases, however, seem to become chronic.

Post-mortem appearance.—In acute cases that have died quickly there is intense inflammation of the larynx and trachea, which are filled with a thick, sticky, reddish-gray exudate, and often clots of blood, which have completely plugged the trachea. In other cases a large yellowish mass may be found obstructing the larynx or trachea, and similar patches may be seen in the mouth and on the tongue. Wart-like nodules may be present on the comb and wattles, and in some cases on the skin. They are yellowish, brown or black, depending upon their age.

Treatment.—Isolate sick birds. When the flock is not seen until a large number are affected, this precaution is too late. Warm, dry, well-ventilated quarters are necessary for successful treatment. Examine those birds making peculiar noises and showing great difficulty in breathing. In many cases a plug of yellow, cheesy exudate can be removed from the larynx with forceps, or popped out by applying pressure, giving immediate relief. Give Epsom salts in a mash at the rate of one-half teaspoonful per bird. Express the cheesy exudate from affected eyes and open and clean out bulging sinuses. Wash out with boracic acid solution. A ten per cent. solution of argyrol is very good for the eyes.

If scabs are present on comb or wattles they can be softened with an application of oil, washed off later with warm, soapy water, and tincture of iodine liberally applied to the sores. Patches in the mouth should be gently removed and iodine applied. Steaming with oil of eucalyptus or turpentine is sometimes very beneficial, provided the birds are not to be placed in cold quarters afterwards. Destroy bad cases; also those that are very slow in recovering, as they may carry over infection and be the cause of another outbreak. If a scab vaccine is to be used the vaccination should be carried out as soon as possible after the trouble starts and all the flock should be done.

Prevention.—Quarantine new birds, and those that have been at exhibitions, for three weeks. Keep out pigeons and wild birds as far as possible, as they may introduce infection. If trouble commences, at once remove affected birds,

clean up and disinfect, watch the birds closely, removing sick ones at the earliest symptoms. Potassium permanganate in the drinking water, at the rate of one-third teaspoonful to each gallon, may help to prevent the water acting as a medium of infection.

Filterability of the causative agent.—The respiratory organs of four birds that died of the acute form of avian diphtheria, with bloody exudate and no yellow patches, were soaked overnight in 100 c.c. of salt solution in the ice chest. The fluid was then filtered through paper and a Berkefeldt candle. The filtrate was shown to be free from bacteria by aerobic and anaerobic cultures. It was then poured into the mouth and nose of four cockerels, and scarified into the combs of two more. Some of the unfiltered fluid was poured into the larynx of four birds in a separate house, having no connection with the others and attended to by a different person.

Two of the birds receiving the filtrate in the mouth developed avian diphtheria, with yellow, cheesy formations in the mouth and larynx. Both birds recovered. The other two remained perfectly well. They were not tested for susceptibility.

One of the scarified comb cockerels developed typical chicken-pox scabs. The second bird did not develop any scab. It was later scarified with virulent, powdered chicken-pox scab, but did not develop any lesions, indicating that it was not susceptible.

The four birds receiving the unfiltered fluid all developed the disease, three showing yellow exudate. Two of these birds died.

This experiment confirms the filterability of the causative agent of avian diphtheria and chicken-pox, and shows that the respiratory condition, frequently termed "influenza," is another form of avian diphtheria.

Production of avian diphtheria with dried, ground chicken-pox scabs.—A healthy cockerel was lightly scarified around the larynx and a suspension of powdered scab in water rubbed into the mouth. This bird died in ten days with typical avian diphtheria. Death was due to suffocation from complete plugging of the larynx with cheesy material. This further shows that chicken-pox and avian diphtheria are caused by the same virus.

Scarification into the comb of spinal cord of an affected bird.—The spinal cord of a bird that died of chicken-pox was removed and scarified into the combs of two cockerels. No lesions developed, the scarification marks disappearing in a few days. Dried scab from the comb of the bird from which the cord was taken was later scarified into these combs and scabs developed in the course of a week, showing that the birds were susceptible and that the virus was not in the spinal cord of the bird examined.

Bacteria isolated from avian diphtheria lesions.—Cultures were made on serum-agar and blood-agar and in sugar broth from diphtheritic lesions of three birds received from different points. The cultures were incubated under aerobic and anaerobic conditions. A mixture of the bacteria isolated was scarified into the conjunctiva and larynx of healthy birds. No lesions developed. These birds were afterwards shown to be susceptible when used for propagating scab for vaccine. At the time cultures were made some of the exudate from two of the birds was scarified into the larynx of two healthy birds, reproducing the lesions.

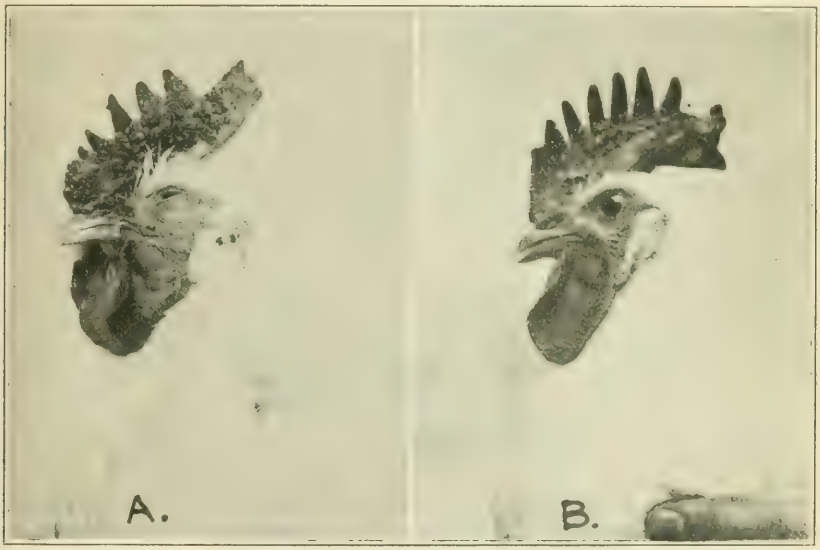
The virus in these cases appeared to be necessary to cause the diphtheritic exudate. The bacteria isolated would not reproduce the lesions when scarified into susceptible birds.

Effect of vaccinia virus on combs.—Glycerinated lymph, used for vaccination

against smallpox, was scarified into the combs of two healthy cockerels. No lesions developed. After two weeks, powdered chicken-pox scab was scarified into the combs and typical lesions developed. It was later noticed that Spinola had already reported the same result. Fowl do not appear to be susceptible to vaccinia virus.

Development of both mouth and comb lesions from an artificial mucous membrane infection.—Exudate from the larynx of a dead bird was rubbed into the mouth of a healthy one. It developed lesions in the mouth and around the larynx, and also chicken-pox scabs on the comb; demonstrating that infection by way of the scarified mucous membrane of the mouth may cause eruption on the comb. None of the other experimental birds developed both types of lesions from a mucous membrane infection.

Development of both mouth and comb lesions from an artificial comb infection.—The combs of six cockerels were scarified and rubbed with a suspension of dried scab just obtained from a very severe outbreak. Good comb lesions



(Original photographs)
Propagation of virus.
A.—Shows heavy growth of scab on comb. B.—Shows poor growth of scab on comb.

developed in all cases. One bird developed a lesion in the larynx. The mass of exudate was removed and the bird recovered. A few days after removal of the scab from their combs two more developed mucous membrane lesions. This was the only instance in which this happened. All the other birds infected in the comb for scab production developed only comb lesions. This may have been an exceptionally virulent lot of scab.

Propagation of virus for making vaccine.—Virus was propagated by scarifying combs of cockerels and rubbing on a suspension of ground scabs in water. In our first attempt we recovered less than had been used as the birds were evidently immune. The same virus on fresh birds produced a good crop. The scabs were removed in about two weeks, dried at room temperature, ground up with pestle and mortar (no ball mill being available) and stored in the ice chest.

Our best yield was 11.70 grammes of dried, powdered scab from six birds; enough to vaccinate 1,170 fowls.

A large proportion of birds died a few days after removal of scabs. The reason for this has not been investigated, but it does not appear to be due to shock, for the much more severe operation of dubbing the comb does not produce such results, and the scabs rub off quite easily. The removal of scabs in treating natural infection chicken-pox does not produce the same results. However, the worst natural cases we have seen do not have an amount of scab that is in any way comparable to that produced artificially.

Vaccination.—Reports on vaccination against chicken-pox for prevention and cure of the disease show varying success. Manteufel successfully protected fowls against infection by vaccination. Hadley and Beach found the vaccine successful as a preventive measure and also that it was useful before marked pathological changes occurred. Mack and Records came to the conclusion that vaccination checked the spread of the disease and exerted a marked curative effect upon visibly affected birds. In two of their flocks trouble was apparently caused by the vaccine. Beach obtained excellent results with a scab vaccine and found it to be a very effective means of promptly checking outbreaks and also to have curative value. Boerner and Stubbs reported that in their hands the Beach vaccine was not of practical value in controlling chicken-pox. Stafseth did not find any curative value in the vaccine and did not test its prophylactic efficiency. Fuller found the vaccine had more of a preventive than a curative value, though benefit was observed from it in treatment. Jorgenson, on a small scale, protected fowls with vaccine prepared from bile and mucous membrane scrapings.

Vaccine.—The vaccine was prepared according to the method followed by Beach in California. Briefly it consists of grinding up and suspending 1.0 gm. of dried scab to 100.0 c.c. of saline, heating at 55° C. for one hour and adding a little preservative. One cubic centimeter is injected subcutaneously in the region of the breast and thigh, where the feathers are thin, after applying a touch of iodine. The vaccine should be used within a week, as unlike the dried virus, it deteriorates rapidly.

Vaccination as a precautionary measure.—A number of birds were vaccinated in August, and half of these again in October. Most of them had been used for feeding experiments, and our space was limited, so that losses from roup, and weaklings dying off, were very heavy in the Fall. The opportunity of infecting the flock did not occur until February, at which time sixty-five of the strongest birds were left.

At the time infection was introduced, half the birds that had been vaccinated once, and half that had been done twice in the Fall, were vaccinated again. Also ten fresh birds, making six groups, as follows:—fifteen controls, ten birds vaccinated twice in the Fall, ten vaccinated twice in the Fall and at time of infection, ten single vaccination in Fall, ten single in Fall and at time of infection, and ten vaccinated for first time when infection was introduced. Four infected birds were put in the house and a suspension of the respiratory organs of two dead birds was scattered around. The flock was watched, and thirteen days later was carefully examined. This seemed to be the peak of the infection. The attack was of a very mild nature. Following are the results as closely as could be ascertained to the nearest whole number.

Seven per cent. of the controls and eight per cent. of the vaccinated birds died.

Sixty-seven per cent. of the controls and thirty-four per cent. of all the vaccinated birds contracted the disease.

The percentages of birds affected among the vaccinated ones were as follows:—two vaccinations in the Fall, sixty per cent.; twice in the Fall and at the time of infection, forty per cent.; one vaccination in the Fall, thirty per cent.; once in Fall and at time of infection, twenty per cent.; once at time of infection, twenty per cent.

Vaccination in the Fall was of no advantage, as those birds show the highest percentage affected among those that were vaccinated and, strangely, it will be noticed that birds done twice in the Fall showed double the number affected in the one vaccination group. Possibly these results are due to the smallness of the numbers in each group. The general results are in agreement with most workers, namely, that vaccination is not indicated as a precautionary measure in a healthy flock, but is useful in controlling and lessening the severity of an attack.

Vaccination as a precautionary measure in a flock in damp quarters and suffering from colds.—The owner of this flock reported that his birds had avian diphtheria. Vaccine for seven hundred birds was prepared and taken out. The litter in the houses was quite damp, the birds were dull, eyes watery, and ring-shaped swellings noticed round the eyes in many cases. Combs were pale and general condition poor. They were beginning to lay, but, as would be expected, the number of eggs was low and slow to increase. There was no evidence of diphtheria, but from the owner's description there had been cases recently on the premises, and the birds being in a condition in which they would be very susceptible to infection, it was decided to vaccinate as a preventive measure. Seven hundred birds were given 1.0 c.c. vaccine subcutaneously. About the same number was left unvaccinated. The vaccinated birds were the breeding stock. The others were the young stock. Housing conditions were the same in each case.

Three days after vaccination what laying there was began to drop off, and in ten days the vaccinated birds all began a full moult. Whether any other factors, such as handling or dampness were concerned we cannot say, but it was reported that no change had been made in the feed. In any case the results were disastrous. No cases of diphtheria developed among either vaccinated or unvaccinated birds.

In the previous experiment it was shown that vaccination was not of value in the Fall as a precaution against possible infection later. In this flock no opportunity was afforded of observing the protective power, but the immediate effects were very bad.

Vaccination to control an outbreak.—This experiment was tried with a flock of two hundred and thirty-two birds. Of these, one hundred and two were vaccinated and one hundred and thirty left unvaccinated. About one-third of the smaller group showed symptoms at the time of vaccination. All birds were kept under similar conditions.

In the vaccinated flock forty birds were affected and nine died. They were well a week sooner than the unvaccinated and no coughs persisted. In the unvaccinated group one hundred birds were affected and thirty died. The birds did not recover as quickly and coughs persisted, in many cases, for a long time. Thirty of this group were mature birds, some of which were definitely known to have had chicken-pox the previous year. These birds remained unaffected throughout, while the young birds were all affected.

In this flock, in round figures, nine per cent. of the vaccinated and twenty-three per cent. of the unvaccinated birds died. Thirty-nine per cent. of the

vaccinated and seventy-seven per cent. of the unvaccinated were affected. There was a more rapid recovery and less after-affects among the vaccinated fowls.

Vaccination to control an outbreak and in treatment of badly affected cases.—In this flock one hundred and sixty out of six hundred unvaccinated birds died. Practically all were affected, but the exact figures are not known. Twenty-five birds in one pen were vaccinated. They were in the early stages. Their droppings were green and several had running eyes and noses. There were lesions in the throat and mouth of a number. The birds on the whole looked sick. None of this lot died though laying stopped completely.

Fifteen serious cases in hospital, that had received considerable individual treatment, were vaccinated, one bird three times, five birds twice, and the remainder once, giving 1.0 c.c. doses. Of these, six died and nine lived, but four of the nine are reported as not being worth keeping. The very bad case vaccinated three times recovered. Three of the birds vaccinated twice lived. Comparisons cannot be made with unvaccinated serious cases as there were no controls, but it would appear that the vaccine was not of much benefit in treating advanced cases.

In whole numbers, twenty-seven per cent. of the unvaccinated birds died. None of the birds vaccinated in the early stages died, but the number tried was small compared to the size of the flock. Sixty-seven per cent. of the serious cases in hospital died in spite of vaccination.

Vaccination in treatment of affected birds.—One hundred and seventy affected birds were vaccinated once with 1.0 c.c. vaccine. These birds were not seen, the vaccine being sent out for them. Eight developed scabs on the comb. These were vaccinated three times with the same dose. In all these cases there was a very bad smell, the eyes were affected and nasal discharge was present. In addition to vaccination, individual treatment was carried out. The vaccine in this case was decidedly a failure, as practically all the affected birds finally died.

Repeated vaccination with larger dosage in treatment of affected birds.—The effect of repeated injections was observed on six badly affected birds at different times during the winter. Some had a pure mucous membrane infection and some both comb and mucous membrane. Four doses commencing at 2.0 c.c. and going up to 8.0 c.c. or 10.0 c.c. were given at two-day intervals. Marked improvement was shown in five birds in from seven to ten days after the first injection. Individual treatment was carried out at the same time. In the birds with comb infection it was noticed that while scabs formed vigorously up to the first week, they did not develop at all after this time. The sixth bird was very thin and it finally died.

As there were no controls and only a few birds, these results should not be considered as more than an indication that possibly heavy and repeated injections might be of value. Further work will be tried with this, though it is a difficult matter to get suitable controls, as the worst looking case is not always the one that dies.

Conclusions

1. An acute infection of the respiratory organs of fowls, with formation of bloody exudate and blood clots in the trachea, that is sometimes seen at, or after, poultry shows was found to be avian diphtheria.

2. The filterability of the causative agent was confirmed and also that the various forms of avian diphtheria and chicken-pox can be produced by the same virus.

3. Bacteria isolated from lesions of avian diphtheria failed to produce lesions when scarified into susceptible birds.

4. The spinal cord of an affected bird, in the one case tried, did not contain the virus.

5. Vaccinia virus did not produce lesions when scarified into the combs of birds afterwards shown to be susceptible to chicken-pox virus.

6. Vaccination was of value in controlling outbreaks of avian diphtheria and lowering the mortality in the mucous membrane form of the disease.

7. Vaccination as a precautionary measure in healthy flocks was not of value, as already reported by Beach and others, and in one case was followed by bad results.

8. Vaccination with the ordinary dosage was not of value in the treatment of bad cases.

9. Five out of six very bad cases appeared to respond to larger and repeated doses of vaccine, but this experiment was not controlled.

10. On the basis of results obtained, work will be continued with the vaccine in the control of outbreaks, and in treatment of affected birds with heavy dosage.

CONTAGIOUS NASAL CATARRH IN FOWL (ROUP)

By Ronald Gwatkin, D.V.Sc.

Much work has been done on this disease without anything very definite being arrived at, other than that the different findings of various workers would rather point to a non-specific causative agent, with many predisposing causes. In this it resembles colds in humans and animals. Unquestionably conditions play an important part, the disease often appearing with cold, wet weather, in damp quarters, or when birds are in a run-down condition due to parasites, tuberculosis, blackhead, intestinal inflammation, and various infectious diseases. Beach describes a nutritional disease resembling roup due to vitamin *A* deficiency.

Roup is etiologically different from avian diphtheria, the causative agent of the latter being a filterable virus, while that of roup is not known. These diseases are reported as occurring together at times. We are certain that in one instance at least we have seen an attack of avian diphtheria complicated with roup, and in which the affected birds died in spite of all treatment. Confusion has existed, and still exists, in regard to these diseases, though clinically there are many differences between them in the uncomplicated forms. Roup has also been used as a blanket name for inflammatory conditions of the head, nose and eyes, thus adding to the confusion in the literature.

A great amount of work has been done on the bacteriology of avian diphtheria, but much less in true roup, as references are made in nearly all cases to diphtheritic membranes, which are not found in the latter disease. It is true that white, caseous exudate forms in the eyes and infra-orbital cells, and sometimes in the cleft palate in roup, but it is not likely to be confused with the adherent yellowish patches found in diphtheria. For purposes of comparison it is interesting to note those bacteria that have been isolated from diphtheritic lesions and tested for pathogenicity by various workers. Harrison and Streit isolated an organism they call *Bacillus cacosmus* and also *Pseudomonas pyocyanea*, with both of which they reproduced lesions. Loeffler considered a diphtheroid resembling the human diphtheria bacillus to be the cause of diphtheria. Hausser blamed a colon-like organism, Muller a rod similar to the human bacillus or Loeffler's organism. Moore found an organism resembling that of fowl cholera,

but could not reproduce the diphtheritic lesions. King, Sigwart and Jackley found similar bacteria. The latter reproduced the lesions. Beach, Lothe and Halpin also found bacteria of the same group, but could not reproduce the lesions. Other workers have isolated such bacteria as streptococci, *Pseudomonas pyocyanea*, and occasionally human diphtheria baccilli. In the report of the Dominion Poultry Husbandman for 1923, Weaver reports an organism found associated with the lesions of roup. Inoculation in adult fowls reproduced the disease in seventy per cent. of the subjects.

Symptoms.—These commence with malaise, the birds sitting around ruffled and droopy. Appetite becomes poor. Lachrymation is noticed in a day or so as also a watery nasal discharge, which later becomes thick and sticky and has a very offensive smell. The secretion plugs up the nasal passages and dries on the outside, necessitating breathing through the mouth, so that the birds sit with beaks open, gasping for breath and making bubbling noises, due to exudate in the trachea. The eyelids become gummed together and large,

(Original photograph.)
The last stages of roup.

white, caseous masses form in the eyes. The cornea becomes cloudy and later eroded. If not attended to early and often, the sight of the affected eye is lost. The infra-orbital cell fills up with a similar material to the eye. The bird is unable to hunt for food and has little desire for it when offered. Weakness is very pronounced. In fatal cases the bird dies in about ten days as a rule, though chronic cases may last for months. A few or many may be affected in a flock. Last year most of our roup cases occurred from November to January, but it may occur at any time during the fall, winter and spring months, and in the summer when accompanying other conditions.

Post-mortem Appearance.—The carcass is emaciated. Mucous membranes of eye, nose and throat are inflamed. A thick, sticky, bad-smelling discharge is present. The trachea may be inflamed and partially filled with an exudate that is not thick and bloody as in avian diphtheria, but a thin, sticky, foamy material. The lungs are affected in some cases, but not as a rule.

Treatment.—Isolate affected birds, clean up and disinfect. In wet weather when houses are already damp, the addition of more moisture, in the form of a disinfectant spray, may do more harm then good. Destroy bad cases and weaklings. Birds to be treated should have warm, dry, comfortable quarters.

Give one-half teaspoonful of Epsom salts twice a week. Feed anything that tempts the appetite, such as bread and milk, but do not leave more before them than they will eat. Massage as much exudate as possible from the nose and syringe out with any mild antiseptic solution, as boracic acid or potassium permanganate, or even salt solution. Liquid paraffin containing a little menthol or oil of eucalyptus can then be instilled if desired. Open the swellings under the eyes and syringe out daily. Keep the eyes open and bathed out. Recovery is usually slow. Birds that do not make a good recovery should not be kept over.

Prevention.—Roup can be largely prevented by having the birds suitably housed and cared for. Light, dry quarters, well ventilated without being draughty, are essential. Overcrowding must be avoided. Cleanliness and frequent disinfection are vital. Quarantine must be practised on all new stock or show birds when brought back. Good and regular feeding are also factors in preventing this and other diseases.

Experimental Work.—In 1923, aerobic and anaerobic bacteria were isolated from cases of roup and tested for pathogenicity, but without results. No special effort was made to reduce the vitality of the inoculated birds, though some used were in poor enough condition without this.

This year, birds from twelve different sources were examined, with a view to finding the constancy of the organisms present and their pathogenicity. Aerobic cultures were made on horse serum agar plates from thirty-four birds from the various sources. Following are the results of these examinations:

1. This group consisted of six birds that had been affected with colds for a week. They were all from the same house. Cultures were made from the nasal passages. A bipolar rod corresponding to *Pasteurella avicida* occurred twice, a diphtheroid twice, *Staphylococcus albus* and *citreus* twice each. Other bacteria present occurred in individuals only and are not listed.

2. One bird with a cold, or the early stages of roup. Cultures were made from the nose. The diphtheroid, bipolar rod, colon bacilli and a fine Gram positive coccus were isolated.

3. One bird with bad case of roup. Culture from upper nasal passages. The diphtheroid, *Staphylococcus albus*, and colon bacilli were isolated.

4. Seven birds with roup. All from the same place, Six cultures were made from the nasal passages and one from an affected eye. The diphtheroid was found in all seven and the bipolar rod in six.

5. Four birds with well defined cases of roup, from same source. Cultures were made from the nose. The diphtheroid was found in one and the bipolar rod in another. The other organisms were not common to this group or any of the others.

6. A turkey affected with tuberculosis. There was a very pronounced state of roup, the eyes being badly affected. Culture from the eyes gave a pure culture of colon bacilli.

7. Three birds with roup, from the same house. Cultures from the nasal passages yielded the diphtheroid once, the bipolar rod once, *Staphylococcus aureus* once, and colon bacilli once.

8. One bird with roup. The diphtheroid and *Staphylococcus citreus* were isolated from the nasal passages.

9. Two birds with roup, from the same house. Nasal cultures were made. *Staphylococcus albus* and a fine coccus were isolated from one bird and *Staphylococcus citreus* from the other.

10. One bird with roup. High nasal culture was made and *Staphylococcus albus* in pure culture obtained.

11. One roup case. Culture from nose gave the diphtheroid and *Staphylococcus albus*.

12. Six healthy birds. Cultures made from the nasal passages in July. These were from the same place as group 1, but nine months later. As far as known they had not been affected. The diphtheroid occurred twice, bipolar rods twice, and *Staphylococcus albus* four times.

Following is the occurrence of the most common organisms in the thirty-four birds: Diphtheroid seventeen times, *Pasteurella avicida* thirteen times, *Staphylococcus albus* twelve times, *Staphylococcus citreus* five times, *Staphylococcus aureus* twice, other cocci four times, and *Escherichia coli* five times. A pure culture was obtained in only two instances, that of the turkey with advanced generalized tuberculosis, from the eye of which *Escherichia coli* was isolated: and a hen with apparently ordinary roup, from which *Staphylococcus albus* was obtained.

The most striking feature of the examination is that the same organisms do not occur in all, or even a majority of birds from the same house, except in group 4, where the diphtheroid occurred seven, and *Pasteurella avicida* six times in seven birds. In group 5 no organism occurred in more than one out of four birds. The same applies to the three birds of group 7, and also to the two in group 9. In the group of six healthy birds, *Staphylococcus albus* appeared four times and the diphtheroid and *Pasteurella avicida* twice each.

Pathogenicity.—None of the foregoing cultures produced any effect when tried on birds. Some were used singly, as the diphtheroid, *Pasteurella avicida* and *Escherichia coli*, and also in combination. All the organisms from each group were tried by scarifying the conjunctiva and larynx and rubbing in the cultures and by injecting up the nose. Two birds were used for each experiment. Discharge from mouth, nose and eye was also transferred to healthy birds in the same manner, but without result. Some of the birds used were affected with parasites and low in vitality while others were healthy and strong.

Cultures.—In checking the cultures the bipolar rods exactly corresponded with a strain of *Pasteurella avicida* isolated from an outbreak of fowl cholera. The diphtheroid was not fully worked out. The other identified cultures corresponded with known cultures of these organisms.

Conclusions

1. We were unable to reproduce lesions with any of the bacteria isolated from affected birds, but the vitality of the experimental birds was not artificially lowered, which is perhaps necessary as natural infection seems to depend largely upon the lowered resistance of the birds.

2. The causative agent of roup does not appear to be specific, as practically identical cases will yield different bacteria on examination.

3. Discharge from mouth, eyes and nose of affected birds did not set up the trouble in healthy ones, rather suggesting that special conditions of lowered vitality are necessary before infection can occur, and emphasizing the value of preventing such taking place by careful housing and feeding, cleanliness, avoidance of overcrowding and proper ventilation.

VENT GLEET (CLOACITIS)

By Ronald Gwatkin, D.V.Sc.

In those references to vent gleet that we have seen, the condition is alluded to as being an infectious disease, usually spread by the male. One or two attempts to transmit the disease, and the fact that the occasional case would occur without any tendency to spread in the flock, led us to doubt the infectious nature of the condition, at least under ordinary conditions. As the symptoms of the disease appeared to coincide with those described in the literature, further experiments were tried, which are recorded here.

Symptoms.—The first thing that draws attention to an affected bird is the frequent passage of droppings, which are fluid and often rather clear in appearance. The mucous membrane is swollen and red. A discharge soon commences, at first thin, later thick, yellowish-white and very offensive. It sticks to the feathers and large masses may thus gather about the vent. The skin becomes inflamed and ulcers form at the juncture of the skin and mucous membrane. The droppings may become normal in a week or so, but owing to the irritation of the cloaca the frequency of passage persists. The condition may clean up in a week or ten days, often to reappear; or it may persist for months, and though apparently healed, break out again. In one case the condition persisted for eight months when it was apparently cured. The subsequent history of this bird is not known.

Post-mortem Examination.—In four bad cases, killed for examination, there was inflammation of the cloaca, from two to four inches of the intestine, and the posterior portion of the oviduct. No other changes were observed in the carcasses.

Treatment.—This appears to be decidedly unsatisfactory. Our practise has been to commence with a dose of salts, wash out the cloaca and clean off surrounding area daily and inject an ounce of an antiseptic or astrigent solution. Chinosol in five per cent. solution, potassium permanganate in one per cent., chlorazene in one per cent., and lye in one-eighth per cent. solution were tried, with little apparent difference in results; though not sufficient birds were treated to make any decision as to their comparative value. The sores were anointed with zinc oxide, pyoktanin and other healing salves. A few of the birds, while apparently cured after some months' treatment broke out again later, some several times.

Transmission Experiments

While these are on a small scale they bear out what we had previously noticed in this condition. Cultures and discharge from affected birds were employed, and groups of birds were also naturally exposed to infection. The results are briefly summed up under the various headings.

Cultures.—Aerobic and anaerobic cultures were made from the cloaca, at the junction of the oviduct, of an early and an advanced case of gleet. The organisms from each case varied. They consisted of a fine Gram positive coccus, colon bacilli, *Staph. albus*, an unidentified Gram positive rod, and a large Gram negative anaerobic spore forming rod. The mucous membrane of the vent of a laying pullet was scarified and the fine coccus and colon bacilli isolated from one case were rubbed in thoroughly. A twenty-four hour broth culture from the cloaca was similarly used, to avoid the delay necessary to isolating colonies and growing on agar slants or in broth. The same thing was done with

the aerobic organisms from the other case, and the anaerobe was similarly employed. All birds remained perfectly well and were observed at frequent intervals for three months.

Filtrate.—At the time of making the cultures a suspension of the affected organs was made, to test for the presence of a filterable virus. A portion of it was filtered through a Berkefeldt candle, tested for bacterial growth, and injected into the scarified cloaca of a laying hen. The bird remained unaffected.

Suspension of Affected Organs.—The unfiltered suspension of organs was injected into the scarified cloaca of a laying pullet, and also of one that had not yet commenced to lay. The cut up portions of tissue were rubbed around inside with forceps. These birds also remained healthy.

Discharge.—A quantity of discharge from a recent case was collected on absorbent cotton and packed into the scarified cloaca of a laying pullet and kept there for five minutes. The bird remained healthy.

Natural Exposure.—A badly infected hen, a cockerel and seven pullets were placed together in suitable quarters under ordinary conditions. Five months later the hen was still affected, though considerably better. None of the others had at any time shown symptoms and all had been regularly examined. The hen and cockerel had been together for two days before the pullets were put in the pen.

Natural Exposure.—This group consisted of a hen in the earliest stages of the disease, one mature male, two cockerels of breeding age, and five hens. These birds were placed together under ordinary conditions and observed for two and one half months. The affected bird went through the usual train of symptoms and appeared practically recovered at the time the experiment was broken up. None of the others showed symptoms at any of the regular examinations.

Conclusion

In view of the foregoing experiments, vent gleet, as investigated here, cannot be regarded as infectious (at all events under ordinary conditions), as natural exposure, infected organs and cultures failed to reproduce the symptoms of the disease.

Further work will be tried with regard to the factors that may give rise to the condition.

EDEMA OF THE WATTLES

By Ronald Gwatkin, D.V.Sc.

Mention is made of this condition by Ward and Gallagher, who quote Seddon as having observed it among fowls in the suburbs of Melbourne, Australia. In these cases the causative agent was *Pasteurella avicida.* Scarification of the wattles of fowls and rubbing in of culture, in one case resulted in general illness, conjunctivitis, edema of wattle, diarrhea and formation of necrotic material. Another bird showed edema and necrosis at point of inoculation. The disease occurred spontaneously among white leghorns possessing large wattles.

Carpenter isolated the same organism from the edematous wattles of a cockerel and a hen. The cockerel died but the hen appeared otherwise normal and recovered. Cultures from both produced an edematous swelling of the wattles in eighteen hours and death in four to six days. In other naturally

occurring cases, *B. coli*, *B. pyocyaneus* and three strains of *Staph. albus* were isolated. The injection of these into wattles of cockerels gave negative results.

Symptoms.—One or both wattles become swollen and hot. On examination a small injury is noticed. On opening the wattle a clear gelatinous fluid runs out. In older cases a caseous material is present, a good deal of fibrous tissue forms and finally the wattle becomes permanently enlarged and wrinkled in appearance. There may be a good deal of necrosis at the point of injury and around it. In some cases the general health does not seem to be affected. In others there are symptoms of general illness, loss of appetite and sometimes conjunctivitis. A few cases are fatal.

Illustration showing side view of infected wattle.

Two cases came to our notice in the month of January and were mentioned in Bulletin 305. In the one instance only one bird, a male, was affected. It was observed to be sick and the swollen wattles were noticed. It died two days after being separated from the others. The head only was sent in, without any description of the condition of the body. *Pasteurella avicida* was isolated from the wattles, both of which were affected. They were still in the acute stage, a good deal of fluid being present. The culture would not reproduce the condition when injected into the wattles of healthy birds.

In the other instance the owner killed three of the affected birds, sending in the heads. Two were cockerels and one a pullet. Two birds had been affected

for two weeks and the other for three. Infection in the pullet commenced in the ear lobe but before it was destroyed the wattle was affected and swelling noticed under the beak. This was the only female affected but only one out of eight cockerels escaped infection. None of these birds showed any signs of ill-health at any time, nor were any of the remaining birds affected. *Pasteurella avicida* was recovered in pure culture from these wattles and also from an amputated wattle sent in later. The only one of these cultures tried reproduced the condition in a healthy cockerel, though the swelling was not as great as in the natural infection.

BACILLARY WHITE DIARRHEA IN CHICKS AND *SALMONELLA PULLORA* INFECTION IN ADULT FOWL

By Ronald Gwatkin, D.V.Sc.

The following notes in connection with our work with bacillary white diarrhea in chicks and *Salmonella pullora* infection in hens are considered of sufficient interest to be recorded here. What little we have done in connection with this disease indicates its prevalence and the need for control in the Province.

Prevalence.—Out of a hundred and seventy-nine young chicks (twenty-four hours to a couple of weeks old) from various parts of the Province examined this spring, *Salmonella pullora* (*Bacterium pullorum*) was recovered from one hundred and seven, while the other seventy-two had died from various causes, as chill, feeding, other infections, etc. Doubtless chills and errors in feeding play a part in lowering the vitality of chicks exposed to *Salmonella pullora* infection but under the best hygienic conditions this infection takes its toll. Out of eight hundred and eighty blood samples from hens, ninety-five were positive, five doubtful, and seven hundred and eighty negative.

Mortality in Adult Fowl Due to Salmonella Pullora.—In 1900 Rettger published his first account of bacillary white diarrhea in chicks. Then Rettger and Harvey, Milks, Rettger and Stoneburn, Jones, Smith and Ten Broeck and others added to and confirmed the work already done.

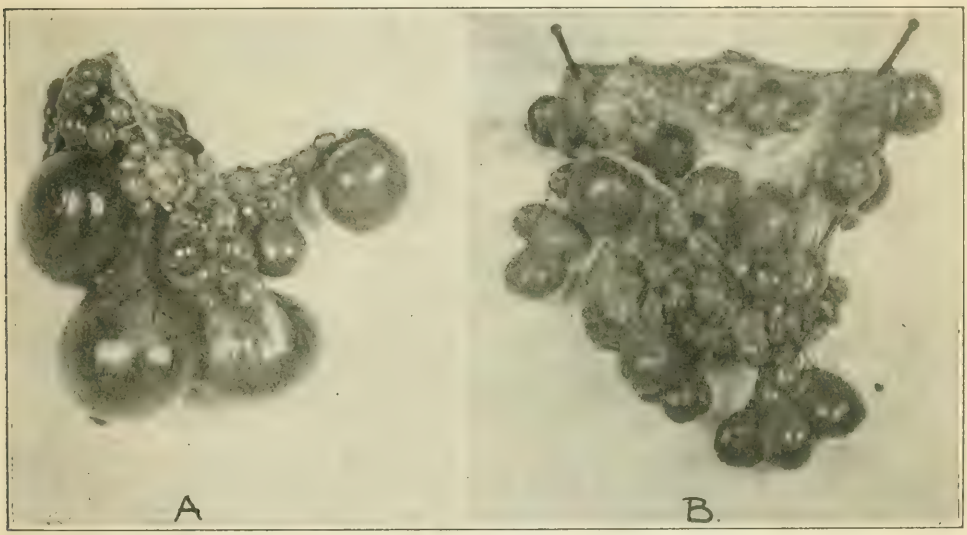
Gage in 1911 examined a number of adult hens dying of unknown causes and found *Salmonella pullora* in the ovaries and reproduced bacillary white diarrhea in chickens with it. Jones, in the same year, failed to kill adult fowls with large injections, but in 1913 reported an outbreak of disease among adult fowls due to *Salmonella pullora*. There had been no bacillary white diarrhea in the flock, but eggs from a neighbour's place, where losses had been heavy, had been incubated on the premises and the eggs that failed to hatch had been fed to the hens. Sixteen days later two or three of the hens that had eaten the eggs died, and from then on for a month fifty fowls died.

The first symptom noted was paleness of the comb and mucous membranes, comb shrunken and scaly. Then the fowls became listless, depressed and droopy. Appetite was lost and diarrhea occurred. A variable course was noted, sometimes terminating fatally in twenty-four hours but usually running a regular course of four or five days or longer. We had not always the opportunity of observing symptoms, but those described by the owners agreed fairly closely with the foregoing.

Post-mortem Examination.—Our cases appeared the same as those described by Jones. The heart was covered with grayish nodules raised above the surface.

The liver was large and friable and showed small necrotic areas. Some fibrinous exudate was present. The ovaries were typical of *Salmonella pullora* infection, having hardened and discoloured retention cysts. The intestines were either normal or slightly inflamed in the first portion of the small intestine. The kidneys were congested. The lungs had nodules and necrotic areas and some showed considerable inflammation. Pure cultures were obtained from the heart, liver, and ovary. The cultures were compared with a culture of *Salmonella pullora* obtained from the Bureau of Animal Industry and with the description of the organism given by Ward and Gallagher from Rettger and Harvey with which they agreed in all particulars. Cultures obtained from the infected ovaries of hens were also tested and were identical with the above.

First Outbreak.—This occurred in June. The flock consisted of ninety-three birds. Fifteen died and a number of the others were affected but recovered. The history was that there had been a similar outbreak in the flock in June of the previous year. It is not known of course whether the infection was the same,



(Original photographs.)
A.—Illustrating normal ovary of hen.
B.—Illustrating ovary infected with Salmonella pullora.

but from the symptoms and proportionate losses it would appear so. This spring the mortality in the chicks had been 50 per cent. None had been bacteriologically examined, but presumably the cause was *Salmonella pullora*, as in an infected flock, chick mortality is usually high. No eggs had been fed. The infection was evidently carried in the ovaries of infected hens, with the usual result of infected chicks, and the unusual one of an outbreak among the mature birds.

One hen, one chick two months old, and another two or three weeks old, were examined. The youngest bird showed little change on *post-mortem* examination, the two months' old chicken showed more, while the hen showed marked lesions as already described. *Salmonella pullora* was recovered from heart and liver of all three and the lungs of the hen. The identity of the cultures was established by comparison with the known one to which reference has been made.

Second Outbreak.—This was reported in September. Birds had been dying

since July and the flock was cut down to half. On post-mortem examination conditions were found as in the other hen, but the raised yellowish-gray nodules on the heart were not so pronounced. The lungs were affected as in the other case. Pure culture was obtained from the heart and spleen. The organism was also recovered from the lungs and liver. Fowl typhoid was suspected, but the organism isolated was shown to be *Salmonella pullora* on comparison with known culture. The blood in this and the other cases was darker than is general in fowl typhoid, but as all the birds received were dead we did not use the hemoglobinometer.

Examination of Ovaries of Hens giving a Positive Agglutination Reaction to Salmonella Pullora Antigen.—In work reported by Jones, the ovaries of twenty-one positive hens were examined. *Salmonella pullora* was recovered from twenty. In carrying out blood tests we had the opportunity of examining the ovaries of sixty hens that gave a positive reaction. *Salmonella pullora* was recovered from fifty-five; spreaders (spore-forming bacteria) had covered two plates, so that it could not be seen whether or not the other colonies were present. Three were negative. It is quite likely that if the ovaries had been crushed with sterile instruments, incubated in broth and some of the broth plated after forty-eight hours, as suggested by Jones, that the organism might have been recovered in all cases; but as the ovaries had not been aseptically removed it was not attempted. Our cultures were surface agar plates from three or four follicles of the ovary at most.

FOWL CHOLERA

By Ronald Gwatkin, D.V.Sc.

A number of outbreaks of fowl cholera were met with during the past year; one in a flock of seventeen hundred birds. Of these, eight hundred mature fowls and a hundred and thirty ducks were on one farm and eight hundred pullets on another place about a quarter of a mile away.

History and Symptoms.—One hundred and fifty of the mature birds, thirty ducks and two of the pullets had died at the time of the first visit. The ducks had been dying for eight weeks. Some had been lame and died slowly, others died suddenly without showing previous symptoms. None of the old ducks were affected at any time in the outbreak. For two weeks the hens had been dying off at the rate of from five to twenty a day. The birds appeared quite well until shortly before death.

A tour of the premises was made. The ducks, with the exception of one, appeared well and bright. This bird had a swollen tarsal joint and was lame, anemic and emaciated.

The hens appeared well and in good spirits, with the exception of two that were a little unsteady in their movements, and two found in nest boxes in a comatose condition. These died shortly afterwards without any struggle. The comb and wattles were intensely congested and the birds could not be roused. An examination of the dropping boards showed that the urates on many of the droppings were yellowish and that diarrhea was present in a number of birds.

Post-mortem Examination.—A thick, tenacious material was found in the mouths of all the dead birds. The esophagus was somewhat inflamed. On removing the skin it was noticed to be reddened over the breast and up along the neck. The heart was covered with hemorrhages, and in one case the gizzard

and intestines were similarly studded. The intestines were inflamed throughout. Spleen was normal. The liver was enlarged and paler than normal. Microscopic examination at this time showed the blood and organs to be teeming with bipolar rods.

One of the dead pullets from the other farm was examined, the same lesions found and also the bipolar rods in the blood. Peritonitis was also present in this case.

One duck, that had died the day before, was examined and the most pronounced hemorrhages in the heart and lungs were seen. The affected joint of the lame duck was opened and bipolar rods found in the exudate. This bird also had the bacteria in the blood.

Recommendations.—The following methods of control were suggested. Use of sawdust on floors and dropping boards and cleaning them off and spraying them daily with 3 per cent. compound cresol solution, or other good disinfectant. Prompt removal and destruction by fire or deep burial of carcasses. Potassium permanganate in drinking water at the rate of one-third teaspoonful to a gallon. Salts once or twice a week. Light diet, with a large amount of bran. Protection of feed and water troughs so as to give the least chance of contamination with droppings. Dipping or wiping off eggs with alcohol to prevent infection of chicks from the shell at time of hatching. (The outbreak occured at a time when eggs were needed to meet orders for chicks, but as far as could be found out no trouble occurred with any of the chicks.)

Results.—Five days later the losses had only been one duck and five hens. The loss in pullets was two a day. These losses increased somewhat later and it was decided to try a bacterin. This was prepared from *Pasteurella avicida* isolated from dead birds in the flock, heated for thirty-five minutes at 58° to 60° C., and of a turbidity equal to 0.5 per cent. in a Hopkins standardizing tube. To this was added 0.25 per cent. of phenol. The dose was 1.0 c.c. About two hundred birds were vaccinated. Five of these died the first week and then no more. The remaining pullets were then vaccinated, making about six hundred in all. The weather now became mild and all birds were let out. The losses ceased almost at once among all the birds so that the results of vaccination could not be observed. It was about this time that the losses stopped in the first two hundred. The sudden clearing up is rather typical of fowl cholera.

Experimental.—During the early part of the outbreak alternate pens were given potassium permanganate and sulphocarbolates in the drinking water. Little difference was observed. The owner states that if any it was in favour of the potassium permanganate.

In order to try the bacterin under controlled conditions, six healthy cockerels obtained from the Poultry Department were placed in a pen together. Three were given 2.5 c.c. injections of the bacterin. Three days later a dead bird from the affected farm was opened up and thrown in. In seven days one vaccinated bird was ill, dying two days later. On the eighth day an unvaccinated bird died. On the sixteenth day, a vaccinated bird died. The remaining two, a vaccinated and an unvaccinated, remained perfectly well. The bacterin did not appear to be of any value in this instance, though it is true that the infection was introduced very soon after the injection of bacterin. The idea was to reproduce conditions of vaccinating in an already infected flock.

Discussion.—Sanitary measures faithfully carried out made an immediate reduction in losses. The termination was doubtless partly due to the disease having run its course, but largely due to change of weather, permitting the birds to go outside.

The outbreak commenced with the ducks and it is interesting to note that none of the old ducks were affected at any time. Had they been infected and were some of them carriers? No history could be obtained of them other than they had been received some fourteen months before. However, age does not confer immunity against fowl cholera, birds of all ages being attacked.

No practical difference was noticed in the pens where sulphocarbolates were used in the drinking water and those where potassium permanganate was employed.

The result of using the bacterin could not be judged as the outbreak stopped quite suddenly at this time. Under experimental conditions it was a failure, unless it be considered that the birds were exposed to infection too soon.

The literature on vaccination is very controversial, and as our own results were unfortunately rendered so inconclusive, we have not reviewed it at this time.

RETURNS FROM THE RECORDS

OF THE

PLEBISCITE

HOLDEN UNDER

THE ONTARIO TEMPERANCE ACT, 1924

STATUTES OF ONTARIO, 1924, C. 65

ON THE

23rd DAY OF OCTOBER, 1924

SHOWING:

(1) The number of Votes Polled in answer to each Question submitted.
(2) The total number of Votes Polled.
(3) The number of Votes remaining Unpolled.
(4) The number of Names on the Polling Lists.
(5) The number of Ballot Papers sent out to each Polling Place.
(6) The Used Ballot Papers.
(7) The Unused Ballot Papers.
(8) The Rejected Ballot Papers.
(9) The Cancelled Ballot Papers.
(10) The Declined Ballot Papers, and
(11) The Ballot Papers taken from Polling Places.

Copy of an Order-in-Council approved by His Honour the Lieutenant-Governor, dated the 13th day of September, A.D. 1924.

Upon the recommendation of the Honourable the Attorney-General, the Committee of Council advise that pursuant to subsection 2 of section 147 of The Ontario Temperance Act, 1924, Your Honour may be pleased to authorize the issue of a Proclamation fixing Thursday, the 23rd day of October, 1924, as the day upon which there shall be submitted to the vote of the electors of Ontario the following questions under the said Act, and fixing Thursday, the 9th day of October, 1924, as the day upon which each of the returning officers will attend at the time and place named in his Proclamation for the purpose of announcing the name of the person appointed to act as representative of those in favour of the affirmative of Question 1, and the name of the person appointed to act as representative of those in favour of the affirmative of Question 2 in his Electoral District.

1. Are You in Favour of the Continuance of the Ontario Temperance Act?

2. Are You in Favour of the Sale as a Beverage of Beer and Spirituous Liquor in Sealed Packages under Government Control?

Certified,

C. F. Bulmer,
Clerk, Executive Council.

STATEMENT OF VOTES POLLED: Number of Polling Booths and Number of Names on Voters' Lists at the Plebiscite held on the 23rd day of October, 1924.

TORONTO
CANADA

Toronto, March 10th, 1925.

To His Honour Henry Cockshutt, Esq.,
Lieutenant-Governor of the Province of Ontario.

May It Please Your Honour:

The undersigned has the honour to present to Your Honour the Fourth Annual Report of the Minimum Wage Board of Ontario, for the year 1924.

Respectfully submitted.

Forbes Godfrey,
Minister of Health and Labour.

Toronto, March 6th, 1925.

The Honourable Forbes Godfrey, M.D.,
Minister of Labour,
Parliament Buildings, Toronto.

Sir,—I have the honour to submit herewith the Fourth Annual Report of the Minimum Wage Board.

I have the honour to be,

Sir,

Your obedient servant,

J. W. Macmillan,
Chairman.

ANNUAL REPORT

MINIMUM WAGE BOARD, 1924

The Minimum Wage Board has now completed its fourth year. It has all along consisted of the same persons, and has pursued the same policy of engaging the sympathy and co-operation of both employers and employees. It wishes to acknowledge the great assistance it has received from these two groups, and feels that it enjoys the support of the great mass of those who are directly engaged in the industries of the Province.

Doubtless it owes this support, in part, to the simple and convincing nature of its work. We have found no employers who will own to a desire to pay less than a living wage. On the other hand, many women-workers who themselves earn much more than our modest schedules enforce see the benefit of the protection we give to their less fortunate or efficient sisters. Besides, the public at large responds to the appeal made by the principle which is the foundation of our work, that a woman who works has a right to live from her work.

The past year has been one of trade depression. Thus our task has been not only to raise the wages which were unwholesomely low, but also to preserve wages from falling below that level. The tables we present show that many low wages have been raised, but they unfortunately cannot show how many wages have been maintained at wholesome levels which otherwise would have sagged below the line of decent subsistence.

Cost of Living Budget

As the minimum wage schedules are based on the cost of living it is necessary to keep close watch on prices. Twice during the year we have investigated each item in the budget of a working-woman. Such changes as have been made because of rising costs have been offset by others where costs have dropped. Thus the total, though not the constituent items, remains the same. The latest revision, within the period covered by this report, is dated October 1st, 1924, and is given below. It is for saleswomen in Toronto, and is the basis from which we estimate the necessary expense for other trades and in other places.

Board and lodging at $7.00 per week		$364 00
Clothing:		
Footwear and repairs, 3 pairs, $5.00, $4.00, $4.00; bedroom slippers, $1.00; rubbers, $1.00; repairs, $2.00	$17 00	
Stockings, 8 pairs	6 40	
Underwear	8 50	
Nightgowns	4 00	
Petticoats and bloomers	5 00	
Corsets, 3 pairs	4 50	
Corset covers	3 00	
Kimona (2 years)	1 25	
Hats, 2 hats	11 00	

Suits (half cost, to wear two years) (or skirt (1 year), $5.00, and light coat (2 years), $12.00).	$11 00

Total per week		$12 50

COMPARATIVE STATISTICS

We are now able to show for the first twenty orders issued, comparisons as to employment, hours and wages over a period of three successive years. We can show similar comparisons, for the next nine orders, over two successive years. These display a picture of industrial conditions in the women's trades, and show the results of the enforcement of the orders.

ORDER NO. 1

This order relates to wages in laundries, dye-works and dry-cleaning establishments in the city of Toronto.

	1921	1922	1924

Orders No. 3, 6, 10

These govern saleswomen in retail stores. The following tables give particulars for groups of typical stores, which are the same throughout the years compared. It is a practical impossibility to gather returns from all the retail stores, so the endeavour is made to present a picture which may be taken as representing conditions generally in the city of Toronto.

Orders Issued During Year 1924

During the year covered by this report ten orders were issued as follows:

Order No. 30

This covers the electrical trades throughout the Province.

Order No. 31

This is a revision of Orders 1, 4 and 5, and supersedes them. It includes certain new regulations respecting hours of work. It covers the laundries, dye works and dry-cleaning establishments throughout the Province.

Orders Nos. 32-33

These cover the theatre and amusement trades in the city of Toronto, and in the rest of the Province, respectively.

Order No. 34

This covers the food trades of the Province (except seasonal canneries) and supersedes Orders Nos. 2, 7, 8 and 9.

Order No. 35

This covers all factory trades of the Province not dealt with in other Orders (except seasonal canneries).

Order No. 36

This covers the tobacco trades throughout the Province.

Order No. 37

This covers the rubber trades throughout the Province.

Order No. 38

This covers the jewellery trades throughout the Province.

Order No. 39

This covers the paper trades and supersedes Orders Nos. 2, 7, 8 and 9.

Inspection

The first line of defence for our clients, who are the working women of the Province, in the enforcement of the orders of the Board, is in the requirement that these orders shall be posted in each establishment where the workers can easily see them. In this way each woman or girl can readily learn what is the limit below which wages may not fall, and can inform us of any violations she knows of.

Next, is the cordial co-operation of Mr. J. T. Burke and the Factory Inspection Branch. The staff of inspectors, as they make their rounds, continually report any establishments where the orders are not posted, as well as any other information of moment. They have, also, on request of the Board, examined

wage sheets, interviewed employees and employers, and thus enabled us to act promptly at any point in the Province where a complaint develops. They have thus saved the expense and avoided the duplication which would have resulted had we been forced to enlist an inspectorial force of our own. Our practice is to meet fortnightly with Mr. Burke, the Chief Factory Inspector, for the consideration of all inspection matters. Twenty-five such meetings were held, where 157 complaints were dealt with, as well as twenty-eight reports from the Factory Inspection Branch, giving details as to the observance of the orders in every part of the Province.

A third and most effective resource is in the annual gathering and study of wage sheets. Incidentally, we are thus collecting a series of extremely valuable industrial surveys, which will be of use to students and statesmen of the future. But our immediate purpose is to hold the wages of women throughout the Province at or above the levels of wholesome living. The collation and analysis of these returns, as given in earlier pages of this report, affords the true picture of the success of our work.

Further, we are in constant receipt of complaints, by word of mouth, over the telephone, and by letter from all sorts of organizations and private persons. Some of these are founded on erroneous conceptions of the law we administer (it is surprising how many relate to the wages of boys and men) and are easily explained away. Others disappear under investigation. A considerable number remain which are justified and result in the redress of the offences reported.

With the increase in the number of our orders, so that the great majority of the women wage-earners of the Province are now protected, the administrative side of our work has naturally enlarged. We are glad to be able to report that so far we have been able to settle all these difficulties in a pacific fashion. We can hardly expect that it will always be so, but we shall continue our policy of exhausting all the methods of peaceful negotiation before invoking the courts. We wish to save the working women concerned from the costs and notoriety which public trials may involve. Moreover, we do not wish to hurt any employer, and, indeed, our experience is that our orders are more often violated through ignorance, inattention or inefficiency than from a wanton purpose to defraud the workers.

Payment of Arrears

During the year the Board has collected arrears of wages due under its orders for a number of female employees. Fifteen firms have made such payments to twenty-five workers. The largest payment in any one case was $149. The total sum collected was $1,017.68.

Permits

In accordance with the authority the Board possesses to allow lower wages for handicapped workers, or to permit variations or suspensions of its orders in certain exceptional cases, we present the following tabular statement:

Number of firms concerned in permits		24
Number of permits expired during 1924		20
Number of permits renewed during 1924		1
Number of permits revised during 1924		1
Number of permits now in force:		
(a) For handicapped workers	36	
(b) For very young girls	2	
(c) Others	1	

The Future

As this report is written a definite promise has been given by the Provincial Government of Quebec that a Minimum Wage Board will be appointed for that Province at this winter's session of the legislature. That will mean that the entire Dominion will be covered by such laws, excepting the Provinces of New Brunswick and Prince Edward Island, and New Brunswick has a commission studying the question. Our hope is that this concurrence of provincial legislation may lead to some co-operation between the Boards of the several provinces.

We have still a few trades of an exceptional type and which employ few women to deal with. There is also the problem of "home work," which no Board on this continent has yet tackled, but which is a matter of moment in the earnings of women workers. We purpose to consider this problem.

Order No. 31

Governing female employees in laundries, dry-cleaning establishments and dye works in the Province of Ontario.

This order supersedes Orders Nos. 1, 4 and 5 and includes them with the following addition:

Hours of Work:

(*a*) The work period for which these minimum wages shall be paid shall not be less than forty-four nor more than fifty hours per week.

(*b*) Work in excess of fifty hours per week shall be counted as overtime and shall be paid for at not less than the minimum wage rates fixed by this order, reckoned on the basis of a fifty-hour week.

(*c*) Work for less than forty-four hours per week may be counted as short time, and shall be paid for at not less than the minimum wage rates fixed by this order, reckoned proportionately to the regular weekly work-period in the establishment.

(*d*) The wage minimums shall be payable for the work period in any establishment within the limits of from forty-four to fifty hours per week. Any worker losing time during the operation of an establishment may be paid proportionately for the actual number of hours worked.

Order No. 32

Governing female employees in theatres and amusement places (including ushers, cashiers and cleaners) in the city of Toronto.

(1) *Minimum.*—No female employee shall be paid wages at a less rate than twelve dollars and fifty cents ($12.50) per week, except in the case of an employee working less than forty (40) hours per week, in which case she shall be paid not less than thirty (30) cents per hour. No working period shall be reckoned for payment as less than two hours.

(2) *Posting.*—Each establishment shall keep a copy of this order posted where it can be readily seen by the employees.

(3) *Penalties.*—Any violation of this order is punishable by fine or imprisonment. (See section 22 of the Act.)

(4) *Complaints.* Any female employee not being paid at least as much as this order requires should report to the Minimum Wage Board, Spadina Crescent, Toronto, phone Trinity 0690.

(5) This order is subject to annual revision by the Board.

(6) This order shall come into force and be effective on April 14th, 1924.

Toronto, March 14th, 1924.

Order No. 33

Governing female employees in theatres and amusement places (including ushers, cashiers and cleaners) throughout the Province excepting the city of Toronto.

This order is the same as No. 32, with the exception of clause (1), for which is substituted the following:

(1) *Minimum.*—No female employee shall be paid wages at a less rate than is set forth in the following table. In the case of an employee working less than forty (40) hours per week she may be paid on the hourly basis. No working period shall be reckoned for payment as less than two hours.

Population Groups	Rate per week.	Rate per hour.
	$ c.	cents
Cities over 30,000, excepting Toronto	12 00	27
The rest of the Province	11 00	25

Order No. 34

Governing female employees in factories making or preparing foods (except seasonal canneries) throughout the Province.

(1) *Minimum.*—No wage shall be less per week than is set forth in the following table:

Population Groups	Experienced workers	Inexperienced adults (over 18 years)	Young girls (under 18 years)
City of Toronto	$12 50	6 months at $10 00 6 months at $11 00	6 months at $8 00 6 months at $9 00 6 months at $10 00
Cities of 30,000 population or over	$11 50	6 months at $9 50 6 months at $10 50	6 months at $8 00 6 months at $9 00 6 months at $10 00
Cities and towns between 5,000 and 30,000 population	$11 00	6 months at $9 00 6 months at $10 00	6 months at $7 00 6 months at $8 50 6 months at $10 00
All below 5,000 population and rural parts	$10 00	6 months at $8 00 6 months at $9 00	6 months at $6 00 6 months at $7 50 6 months at $9 00

No worker who begins as a young girl shall, after reaching the age of eighteen years, receive less than the wages prescribed for an inexperienced adult. The following regulations shall apply in all cases where minimum wage-rates are concerned.

(2) *Maximum of Inexperienced Employees.*—The number of inexperienced adults or young girls in any establishment shall not exceed one-third of the total female working force, nor the number of inexperienced adults and young girls together exceed one-half of the total female working force. Temporary employees,

whose term of employment does not exceed one month, shall not be subject to this rule, nor be included in this calculation. This rule shall not apply where the female working force is four or less.

(3) *Piecework.* The wages paid to each time-worker and to each piece-worker during the first six months' employment in the industry shall conform to this order. In the case of piece-workers of more than six months' experience, it is sufficient if at least 80 per cent. receive wages conformable to this order.

(4) *Averaging Piecework Rates.*—The wage rates may be averaged for any pieceworker, provided that the average is maintained at each payment. Wages received before this order became effective, or more than three months before the date of the payment concerned, shall not be considered in any such calculation.

(5) *Deductions for Absence.*—No deduction below the minimum wage line for absence shall exceed the value of the time lost, reckoned in proportion to the normal working hours in vogue in the establishment.

(6) *Waiting.*—An employee required to wait on the premises shall be paid for the time thus spent. Pieceworkers shall be paid at a rate not less than that fixed for the class to which they belong.

(7) *Penalties.*—Any violation of this order is punishable by fine or imprisonment. (See section 22 of the Act.)

(8) *Posting.*—Each establishment shall keep a copy of this order posted where it can be readily seen by the employees.

(9) *Complaints.*—Any female employee not being paid at least as much as this order requires, should report to the Minimum Wage Board, Spadina Crescent, Toronto. Telephone Trinity 0690.

(10) This order is subject to annual revision by the Board.

(11) This order shall come into force and be effective on September 1st, 1924, Orders 2, 7 and 8 and 9 are hereby superseded for factories to which this order applies.

Toronto, July 23rd, 1924.

Order No. 35

Governing female employees in all factory trades not dealt with in other orders (excepting seasonal canneries) throughout the Province.

This order is the same as Order No. 34.

Order No. 36

Governing female employees in the tobacco trades throughout the Province.

This order is the same as Order No. 34.

Order No. 37

Governing female employees in the rubber trades throughout the Province.

This order is the same as Order No. 34.

Order No. 38

Governing female employees in the jewellery trades throughout the Province.

This order is the same as No. 34 with the exception of clause (1) for which is substituted the following:

(1) *Minimum.*—No wage shall be less per week than is set forth in the following table:

Population Groups	Experienced workers	Inexperienced adults (over 18 years)	Young girls (under 18 years)
City of Toronto	$12 50	6 months at $9 00 6 months at $10 00 6 months at $11 00	6 months at $7 00 6 months at $8 00 6 months at $9 00 6 months at $10 50
Cities of 30,000 population or over.	$11 50	6 months at $8 00 6 months at $9 00 6 months at $10 00	6 months at $7 00 6 months at $8 00 6 months at $9 00 6 months at $10 50
Cities and towns between 5,000 and 30,000 population	$11 00	6 months at $7 50 6 months at $8 50 6 months at $9 50	6 months at $6 00 6 months at $7 00 6 months at $8 00 6 months at $9 50
All below 5,000 population and rural parts	$10 00	6 months at $7 50 6 months at $8 50 6 months at $9 50	6 months at $6 00 6 months at $7 00 6 months at $7 00 6 months at $9 00

No worker who begins as a young girl shall, after reaching the age of eighteen years, receive less than the wages prescribed for an inexperienced adult.

Order No. 39

Governing female employees in the paper trades (which include printing, bookbinding, paper box making, paper bag making, manufacturing stationery and other trades making paper or paper products) through the Province. This order is the same as Order No. 34.

Dr. J. W. Macmillan, *Chairman.*

Agricultural Development Board

Honourable John S. Martin,
Minister of Agriculture,
Parliament Buildings, Toronto, Ont.

Honourable Sir:—I have the honour to submit the Third Annual Report of the Agricultural Development Board for the year ending October 31st, 1924.

The outstanding points in the record of the year are an increase in the number though not in the volume of loans, an absence of any loss of principal and a surplus of earnings over outlay amounting to $26,705.34.

Details of Long Term Loans

The following table gives the comprehensive statement of loans granted last year as well as during the former years:

	Number of applications passed	Amount of loans passed	Value of security
1922	458	$2,040,605 00	$4,693,304 00
1923	953	3,729,350 00	8,685,166 00
1924	990	3,582,150 00	7,871,026 25
Total	2,401	$9,352,105 00	$21,249,496 25

As will be seen, the number of loans passed by the Board increased, although the aggregate amount was slightly less than the previous year. The trend during the year was marked by certain special features. During the early part of the year the applications for loans increased greatly over the same months of the previous years.

Some of the spring months show an aggregate double that of the same months a year ago. In the autumn, however, there was a very distinct falling off as compared with the same months of the year previous. Whether this was an indication of improved conditions during the season it is impossible to say.

In Old Ontario the loans granted numbered 732 aggregating $3,126,600 as against inspection valuation amounting to $6,737,902. The loans granted therefore averaged $4,271.31. In New Ontario 258 loans were granted involving $455,550 as against inspectors' valuations of $1,133,124.25. These loans averaged $1,765.69. It will therefore be seen that the aggregate of loans is well under fifty per cent. of the aggregate of value, as might be expected from the fact that very few individual loans exceeded this percentage. In addition to the applications passed, about one-third as many were refused. This may be taken as an indication of the care exercised in scrutinizing each application.

During the year the Board has been served by its own legal department. This change in the system has worked out very satisfactorily, and the legal work has been done as promptly as the circumstances would permit and at a minimum cost to the borrower.

While the loans passed by the Board aggregated over $9,000,000 only a little over $7,000,000 has been actually paid out. The difference is explained by the number of loans which are in the legal department awaiting completion as the year closes, and by the number of cases where the Board has been unable to pass the full amount desired and the amount offered is subsequently not accepted.

Foreclosures

During the year a very great deal of attention has been paid to the matter of checking up the valuations and making collections of payments in arrears. In the course of this work five properties were turned over to the Board by borrowers. In four of these cases the action was voluntary on the part of the mortgagors, owing to the fact that they had become so involved by means of second mortgages and other liabilities that they were unable to see a way out. In the other case the mortgagor was found attempting irregularities and summary action appeared justified. Naturally the Board endeavoured to dispose of the properties at the earliest possible time and they were reasonably successful in doing so. Before the end of the year all properties, with the exception of one, were disposed of at figures which repaid all the principal of the loans, and most of the arrears of interest. In one case the property was sold for considerably more than the interest of the Board, and this amount, contrary to usual practice in such cases, was turned over to the borrower. Where, however, the receipts were insufficient to meet the total amount of principal and interest, the difference was absorbed by the Board and amounted during the year on all the transactions to a little less than $1,000.

Repayments

As to repayments, the amounts involved were necessarily very much in excess of the previous year on the small volume of business. Last year it will be recalled the Board reported that the sum of $1,394.61 was still outstanding at the close of the fiscal year. This has since been paid up with the exception of a few hundred dollars which are secured by sale notes realizable in the course of a few months. As far as that year is concerned, therefore, it has been possible for the Board to avoid carrying over indebtedness for a longer period than twelve months, which is the objective at which the Board aims. Dealing now with the past year it may be stated that on December 1st, 1923, the sum of $105,807.12 was due. This has all been paid up with the exception of $2,992.66, so that there is only 2.83 per cent. which is being carried for a longer period than ten months. On or about May 31st, the sum of $106,609.77 was due. Of this all but $18,276.39 has been paid and hence 17.14 per cent. is being carried a longer period than five months. In all these matters it has been the policy of the Board to endeavour to safeguard the interests of the borrower as well as the interests of the Province. While being reasonably sympathetic in all cases, and necessarily some cases of real hardship are encountered, the Board has endeavoured to impress the fact that these loans be dealt with on a strict business basis.

Short Term Loans

The following table gives the present situation in regard to the short term loan associations.

FARM LOANS—SHORT TERM

Association	No. of borrowers		Loans Oct. 31, 1923	New Oct. 31, 1923-24	Principal received	Interest due	Interest received	Balance loans Oct. 31, 1924
	Oct. 31, 1923	Oct. 31, 1924						
Balfour-Rayside	49	37	$19,737 50	.....	$6,804 03	$1,355 68	$1,026 81	$12,933 47

Mosa	16	18	9,760 00	4,075 00	3,975 00	424 90	424 90	9,860 00
Nassagaweya	28	23	18,061 60	3,625 00	7,948 72	1,210 01	1,177 51	13,737 88
Nelson	26	21	19,700 00	3,250 00	4,875 00	1,291 69	1,226 52	18,075 00
North Grimsby	30	26	23,750 00	10,200 00	15,374 87	1,278 33	1,286 74	18,575 13
Roxboro	26	21	17,300 00	1,700 00	3,200 00	1,020 63	1,020 63	15,800 00
Sault Ste. Marie	16	16	6,477 97	2,975 00	5,700 00	469 89	462 64	3,752 97
Seneca	7	8	3,575 00	800 00	.....	166 73	166 73	4,375 00
Toronto	25	19	31,125 00	3,875 00	16,974 20	2,013 41	2,034 72	18,025 80
Trafalgar	29	33	27,150 00	11,650 00	6,100 00	1,309 92	1,309 92	32,700 00
	399	344	$279,673 40	$53,750 00	$102,020 66	$17,051 40	$16,622 83	$231,402 74

There is very little which need be added. It will be seen that, of the $279,673.40 which was on loan on October 31st, 1923, the sum of $10,020.66, or around forty per cent., has been repaid as well as interest being paid practically in full. During the year, however, new loans aggregating $35,750.00 were made. The net result, therefore, is that the amount outstanding under the head of the Short Term Loans is approximately $50,000.00, less than a year ago.

Surplus of Earnings

From the standpoint of administration it is gratifying to report a substantial surplus of earnings as a result of the operations of the Board for the fiscal year just closed. Full details will be found in the financial statements attached hereto. The earnings of the Board consist of inspection fees, legal fees and the 1% difference in the amount which the Board pays on its bonds and debentures and the rate charged to borrowers. As will be seen by the statement, the earnings of the Board aggregate $373,824.44. The expenditures, including cost of administration and accrued interest on bonds and debentures was $347,119.10, thus showing a surplus of $26,705.34 for the year. After making allowance for the deficits which were included in previous reports, covering the initial and less productive years, it will be seen that the net surplus on the administration of the Board since its inception aggregates $15,641.52. With passing years and increasing volume of business this should be augmented substantially and should make ample provision for any possible losses which are inevitable in work of this nature.

All of which is respectfully submitted,

15 Queen's Park,
Toronto, February 19, 1925.

A. G. Farrow,
Chairman.

TORONTO
CANADA

To His Honour Henry Cockshutt,
Lieutenant-Governor of the Province of Ontario.

May It Please Your Honour:

I have the honour to present herewith the Fourth Annual Report of the Mothers' Allowances Commission for the year 1923-1924.

Respectfully submitted,

Forbes Godfrey,
Minister of Health and Labour.

FOURTH ANNUAL REPORT

OF THE

Mothers' Allowances Commission

For the Year 1923-1924

COMMISSION

REV. PETER BRYCE, *Chairman.*
MRS. ELIZABETH SHORTT, M.D., *Vice-Chairman.*
MRS. MINNIE SINGER.
MR. A. J. REYNOLDS.
LIEUT.-COL. T. J. MURPHY, K.C.

The Mothers' Allowances Act has been in force for four years. The social values of the Act should now in some measure be apparent. Our Local Boards were asked to forward a statement indicating the social values of the Act as observed in their own district. Extracts from these statements are included in this, the Fourth Annual Report of the Commission.

It is a matter of regret to the Commission that space prohibits the publication of these statements in full, as they pay remarkable tribute to the transformation that has already been effected in many homes and in many lives through the operation of the Mothers' Allowances Act.

In over 4,000 homes in Ontario there has come, through the Mothers' Allowances Act, a higher standard of living, and in these homes there are over 12,000 children with larger opportunities for health, education and happiness. It is gratifying to be able to report that the vast majority of the mothers are giving good care to the children. Reports in respect to each family reach the central office periodically through the visits of the supervisors. A small percentage of the mothers need constant supervision.

There are fully five hundred members serving gratuitously on the Local Boards and the service they are rendering is of very great importance in the administration of the Act. This involves, in many cases, the visitation of the applicant in her home. Frequently, through the Local Boards, applicants are helped in the establishing of a suitable home and much kindness is shown in various directions. The interest in the applicant and beneficiary manifested by the Boards has grown each year and the service rendered by the Boards has steadily grown in value.

Some feared that the Mothers' Allowances Act would lessen private philanthropy, but the experience of the past four years in the administration of the Act shows, with the splendid co-operation and practical helpfulness of

churches, service clubs, etc., etc., that private philanthropy has been greatly stimulated in respect to the care of the widow and the fatherless.

We appreciate the generous co-operation of the municipalities in the administration of the Act and their prompt payment of their share of the cost of allowances, which last year totalled $806,539.50.

It is of interest to note that 92.9% of the beneficiaries are of British birth; 68.7% of that number being Canadians. Only 7.1% are naturalized Canadians.

There is an increasing number of applications on the ground of the husband's total and permanent incapacitation. Each application of this nature must be supported by a medical report on our own medical form, and only if the husband is shown to be totally and permanently incapacitated is an allowance recommended. If the husband is an advanced case of tuberculosis and in a sanitarium, we have recommended an allowance although the physician may not be able to state that the case is an incurable one. The necessity for the immediate removal of the tuberculous patient to a sanitarium has been again and again shown in the records presented to us. In one family seven children were infected because the tuberculous father was permitted to remain at home.

Statistics relating to the death of the father reveal that pneumonia, tuberculosis and influenza are responsible for 45.3% of all deaths. Accidents are responsible for 284 deaths, and 196 died of cancer, while forty-nine of the fathers committed suicide and ten were murdered.

The Commission acknowledges the cordial support and unfailing courtesy of the Honourable Forbes Godfrey, M.D., Minister of Health and Labour, in all matters relating to the administration of the Mothers' Allowances Act.

Signed on behalf of the Commission,

PETER BRYCE,
Chairman.

The Commission met in the early part of each month, and during the year had some 6,390 cases under consideration.

Payments were made as follows:

1923	Number of Beneficiaries	
November	3,870	$137,763
December	3,919	139,360
1924		
January	3,921	139,626
February	3,979	141,729
March	4,023	143,494

*Less $490 or 50% of $980 refunded by D.S.C.R. (Ottawa).

The amount appropriated by the Legislature for the payment of allowances was $1,710,000, of which $1,707,894 was expended, leaving a surplus of $2,106.

The amount disbursed, viz., $1,707,894, was distributed throughout the Province as under:

Counties	$628,194
Cities	881,515
Separated towns	32,395
Indian Reserves	4,190
Judicial Districts	161,600
	$1,707,894

Under the provisions of the Act $768,372 of the total amount disbursed has been charged to the organized municipalities of the Province, chargeable to:

Counties	$313,787
Cities	436,505
Separated towns	15,985
Federal Department of Indian Affairs	2,095
	$768,372

and the balance of $939,522 assumed by the Province, representing:

50 per cent. of allowances paid in organized municipalities	$768,372
100 " " " Judicial Districts	162,650
100 " " " organized municipalities where one year's continuous residence in the municipality had not been established	8,500
	$939,522

The amount collectible from municipalities for the year 1923-1924 was:

1923-1924	$768,372.00
Plus the amount outstanding at 31st October, 1923	102,817.50
Or a total of	$871,189.50

REVENUE STATEMENT

The sum of eight hundred and six thousand, five hundred and thirty-nine dollars and fifty cents ($806,539.50) was deposited with the Provincial Treasurer in semi-monthly payments throughout the year and credited to:

Amount at our credit in the Treasurer's books at 31st October, 1923:

Beneficiaries	375	
Cancelled cheques	235	
		1,750.00
		$806,539.50

The amount outstanding at 31st October, 1924, was $117,972.00, chargeable to:

Counties	$52,297.00
Cities	62,730.00
Towns	2,712.50
Indian Reserves	232.50
	$117,972.00

This includes charges for October, 1924, statements of which were not forwarded to Municipalities until November, 1924, or after the close of the fiscal year.

ADMINISTRATION

The sum of $90,325 was appropriated for administration expenses. The sum of $74,188.63 was expended, leaving a surplus of $16,136.37.

The cost of administration has decreased to 4.34% in 1924.

This is 13.21 per cent. of total amount of allowances paid during the year.

CAUSES OF CANCELLATION

One of two children now 16 years of age or not at school	292
Beneficiary remarried	130
Should now be self-supporting	86
Unsatisfactory home conditions	84
*Husband no longer totally and permanently incapacitated	46
Beneficiary no longer resident in the Province of Ontario	27
Only one child or no children with the mother	25
Husband no longer in asylum	22
Beneficiary died	20
Now in possession of assets of a disqualifying amount	13
Now in receipt of allowances from other funds	10

Now in possession of disqualifying equity in property	9
Incapacitated husband died and only one child under 16 years	7
False information at the time of application	6
Voluntary withdrawal	3
Beneficiary in an institution	3
Incapacitated husband no longer in care of wife and only one child under 16 years	2
Residence of husband now known (desertion cases)	2
Total	787

*In many cases the cause of incapacitation of the father was due to tuberculosis and he has sufficiently recovered to be able to return to work. An allowance is recommended if the tuberculous husband is a patient in a sanitarium.

CAUSES OF INELIGIBILITY

Sufficient income to maintain the home	153
Applicant's husband or child over 16 years not totally and permanently incapacitated	66
Only one child under 16 years in attendance at school	51
Five years' desertion by husband not established	35
Value of property disqualifies	27
Unsatisfactory home conditions	32
Residence requirements not fulfilled	23
Older children's earnings should maintain the home	10
Foster-mother applications ineligible as children are not orphans	10
In receipt of military pension	10
Children not with the mother	10
Applicant in receipt of Workmen's Compensation grant	7
Applicant not a British subject	5
Only one child under 16 years and incapacitated husband not in wife's care	5
Applicant divorced or legally separated	4
Applicant remarried	4
Application withdrawn	3
Applicant's husband in prison	2
False information given	1
Unwarranted expenditure of assets	1
Total	459

CAUSES OF INCAPACITATION OF FATHER

Insanity (husband in asylum)	126
Tuberculosis	101
Paralysis	59
Heart, diseases of	41
Arthritis	34
Locomotor ataxia	16
Cancer	14
Brain, diseases of	12
Hardening of the arteries	12
Respiratory system, diseases of	11
Kidney, diseases of	9
Epilepsy	9
Alimentary system, diseases of	7
Pernicious anaemia	7
Other causes	17
Total	475

While venereal diseases are not mentioned in our lists of causes of incapacitation or death, yet the history of many cases, particularly in classes 1, 3, 4, 6, 8 and 9 as above, indicates that venereal diseases were causative factors to a numerically large extent.

CAUSES OF DEATH OF FATHER

Pneumonia	747
Tuberculosis	409
Influenza	355
Heart, diseases of	375
Accident	284
Cancer	196

SOCIAL RESULTS AS OBSERVED BY LOCAL BOARDS AFTER FOUR YEARS OF OPERATION OF THE MOTHERS' ALLOWANCES ACT

The members of the local Boards, who have had an opportunity of observing closely the effects of the Mothers' Allowances in the homes of the widows living in their communities are unanimous as to the good results in such families from such allowances, and the benefit to the community of these results. Almost all the Boards have noted in particular the increase in educational advantages for these children and the opportunity given them by the allowance for training for future citizenship. Extracts from the reports of the local Boards are given below, as we cannot print these reports in full:

Educational Opportunities

"This aid gives the mothers an opportunity to educate their children, and make them fit members of society, with a fair chance of earning their own living, rather than having them run the streets and become later on a burden on the community through the lack of parental ability to care for them."

"Four of the five families in this district have taken a new lease of life and are being morally trained and cared for and will be a benefit to the community. On the whole, our Board finds that our mothers are pleased, relieved of worry, and able, consequently, to raise a healthy and educated generation."

"We find the Act plays an important part from the point of view of school attendance. I have consulted with teachers where they have beneficiaries of the Act as pupils. Not only does it make it possible for the child to remain in school, but also to be dressed as other pupils are dressed. Thus there is no feeling of inferiority, and with a contented mind a pupil can do better work."

"Families have been kept together and children have been given an opportunity to get a fair education while under home influence, which cannot help but be a factor in making these children better citizens in the days to come."

"Criticism of the Act has disappeared in our city, possibly because those who criticized have been watching the changes that have taken place in some of these families. If so, they cannot help seeing that instead of the children they used to know in some of these homes who were not given much consideration by their more fortunate schoolmates on account of the pinched circumstances of their home surroundings, they may now see many of these children to-day, after a year or two of Government assistance, manly boys and tidy girls who no longer shrink but show a certain spirit of independence and are ready to insist that they be given equality of opportunity with other children."

"We find the Act a great help, not only to the widows in the county, but to the schools. These children are sent to school more regularly than ever before, as in the father's time the small boys were kept from school to help in the plowing and harvesting. Now the mother knows this cannot be done. Teachers notice the difference, and that widows in some parts of the county are saving and sending their children on for higher education, and we feel sure, knowing their old circumstances, that this could never have been the case without the help of the Act."

"Widows are impressed with the idea that their children need a good education which will lead to their ultimate success. This, I think, is one great outstanding feature of the Act."

"The regularity of the contribution to the household enables a systematic planning of economics and is one of the Act's chief merits. This, needless to say, gives opportunity, among other things, for regular school attendance and immeasurable results in future citizenship."

"Because of the practical interest taken by the Investigator and local Boards, the mother gets a deepened sense of her responsibility to train her children for citizenship and right living. These children cannot do otherwise than think well of the country which has made it possible for them to have a real home, and they are growing up to be loyal, patriotic citizens."

"To the best of our knowledge, those under our charge are using their allowances to the very best advantage, thus making better homes and educating their children in such a way as to enable them to go through life a credit to themselves and to the town to which they belong."

"The physical, mental and moral well-being of the families receiving this support is in every case in our county better, and the children are receiving education which otherwise it would be almost impossible to give them"

"We find here, that the main virtue of the Act lies in the fact that the mother, with the knowledge of a regular allowance, may plan her affairs to an advantage, impossible where she is sole breadwinner or where assistance comes spasmodically, and that she is inspired to maintain a higher level of conduct and efficiency as a mother."

Improvement in Home Conditions

The changed outlook in many of these homes has been spoken of by the local Boards in their reports:

"Merely from the standpoint of a scheme of relief, the Act's advantages over any other method, either civic or personal, are apparent It is regular in its payments, giving a sense of stability. The recipient looks upon it as in some sense a wage for public service, rather than as a dole to a pauper. This makes for self respect. In very many instances we have noted, with great pleasure, that the whole tone of the home has been raised by the receipt of an allowance. Mothers who have been indifferent housekeepers and home makers, through the efforts of the Investigator and the local Board, become thrifty, cleanly and painstaking. The children are better clothed, better fed, and even better mannered, and a chance for education and advancement is given them."

"In almost all cases it has given the widows encouragement to work so that the children may benefit to the fullest extent from the Mothers' Allowances, with the results of thriftiness in families, attention to school curriculum and a desire for efficiency on the part of the children."

"In my memory I compare some of the widows of to-day with the widows some two or three years before they received the allowance, and the careworn, fretful expression of their faces, thoughts that were always in the past or on the gloomy surroundings of their present circumstances, no heart to plan or figure for the future; the rippling laughter of their girlhood was unknown to the children who looked to them for support."

"To-day, when I enter some of these homes, I find the mother spending her time in profitable employment; she needs no encouragement for the future; her allowance has given her a foothold to face the problems that confront her, and when talking with her she may tell of some of the latest difficulties she has overcome, but her main topic is her plans for the future and appreciation of the assistance that is given her. In most cases it is such genuine appreciation that the listener cannot help but feel a glow of gladness in his heart, knowing that his little contribution to the municipality and the Province helps to make this change in the homes of the fatherless possible."

"We have seen evidence of the beneficial results of state aid in improved home conditions, where before was nothing but poverty and distress, the mother untidy and discouraged, the eyes seeming to have no expression but one of weariness and despondency. All this has been changed as if by magic. The whole atmosphere of the homes breathes happiness and comfort under the wise and always beneficent influence of the Mothers' Allowances Act, replacing private charity with the limitations of amounts, its demoralizing effects and its destruction of self respect among our people."

Other Social Results of the Act

Another point which has been commented upon is the rareness of delinquency in Mothers' Allowances families.

"I think the mothers in almost every case are fully appreciating the work of the Commission, and delinquency is a very rare thing indeed. It also has its effect in improving the general surroundings of the home, because the mothers have felt that the Board was keeping an eye on them and in consequence they felt it was their duty to live up in every way to the spirit of the Act."

"While the allowance, of course, has been limited, as this is a new law in our Province, it has been sufficient in most cases to enable the mother, who would otherwise have been in dire poverty, to enjoy with her family the blessings of home life and give the children the necessary upbringing and education for life."

"It is worthy of note that notwithstanding the vitally important position of the father in the family and while many families deteriorate to a deplorable extent during his prolonged absence, not one boy or girl from these fatherless and subsidized homes has caused us any worry or developed any anti-social trait."

Some of the Boards have expressed the opinion that interest in and a sense of responsibility towards these fatherless children has been stimulated rather than discouraged by the Mothers' Allowances Act.

"I find, also, that friends of a family who come under the Act seem to take a greater interest and are more eager to give these families assistance than they would be otherwise, so that the Act, with the interest created by members of a local Board, seems to act as an incentive for others to help."

"The main feature of the Act is that while the allowance does not cover the full maintenance of the family, yet it is just enough to give encouragement to the mother, so that, with careful management on her part and by doing a little work to supplement the allowance, she is able to keep herself and family comfortable in every respect. Were the allowance made to cover the full maintenance it would create wastefulness and probably laziness. Without any assistance the mother would become discouraged and lose all interest in herself and family. The encouragement thus given to the mother to be industrious and endeavour to get along has a good deal to do in making her family likewise."

The opinion of the local Boards, as expressed in their reports, is that the Mothers' Allowances Act is in good repute.

"Anyone who has observed the working of the Mothers' Allowances Act can have no doubt as to its value as a constructive piece of social legislation. If, as is frequently stated, 'the home is the heart of the nation,' an Act that has done so much to improve conditions in so many homes should be given the credit it deserves. I have visited many of the beneficiaries and am quite satisfied that the results more than justify the expenditure. In fact, I challenge our critics to visit any ten homes receiving the allowance and not be convinced."

"One of those interested in introducing a measure for Mothers' Pension in the British House of Commons last year, after examining the Acts in operation in different countries, told me 'the Ontario Act was the best she had seen.' I was delighted to hear that our Province was known abroad for her good works."

"I might say further that I am at the meetings of every County Council as County Solicitor and County Clerk and I have never heard any member of the Council object to the payments which are made for this purpose."

"From the very few criticisms we hear of the Act one would infer that it is giving general satisfaction and that the public are willing to encourage any effort put forth for the betterment of the child life of the community."

"Such relief has given the Act a high place in the opinion of our citizens. Having been Chairman of this local Board since its formation, I have yet to hear one word of complaint on the part of any taxpayer of the cost of these allowances."

"We are pleased to tell you that the general public are most sympathetic. Seldom do we hear the least complaint, and in many cases 'Give all you can.' The work now seems a positive necessity and I do not believe that our people would wish any reaction whatever."

"This local Board has functioned for the last three years without a break in its membership, quietly and successfully we are assured, doing a share in a work that is a credit to the Province and a testimony that, after all, the great public is not so indifferent to the woes and wants of others as it is assumed to be."

Gratitude of the Mothers

The Boards have spoken also of their knowledge of the attitude of the mothers towards the help they receive under the Act.

"Gratitude is expressed in each beneficiary's home, not only for the monetary assistance, but for the timely advice and guidance of the visiting Investigator."

"Not a week passes but I receive a letter or a visit from some mother who is grateful for the monthly cheque that does not fail."

"It is amazing also and worthy of note how in almost every case the allowance cheque is received and welcomed without the recipient being conscious of or even thinking that she is receiving so-called charity."

"I should like to tell you of the appreciation of one of our mothers in her own words:

" 'Thank God for the help I receive from the Mothers' Allowance. It is truly a wonderful blessing, which enables me to keep my children with me and properly care for them.' "

"A mother said to me recently, 'Please thank everybody who has had anything to do with this allowance. I don't know what I would have done without it. "

"I have been particularly touched by the gratitude of those mothers with whom I have come in personal contact. Frequently, after receiving their first cheque, they telephone to thank the Board for its help in getting on, which all goes to prove that they really appreciate the little enough trouble we take for them."

"All are keenly appreciative of that steady monthly cheque which gives them such a feeling of security in providing essentials and thus maintaining a standing in the community."

"Then, too, there is the personal touch supplied by the Investigator. I believe the majority of our mothers look to the Investigator for sympathy, guidance and advice. The periodical visit of this officer to the home provides a connecting link between the mother and the Commission."

"It will never be known just how much good has been accomplished by our Investigators. 'Home missionaries' seems to describe these fine women, who not only advise the mothers in the careful expenditure of their incomes, but who cheer and encourage those under their care. One mother told me that she cried bitter tears over her first payment, to think that it was necessary that she

must accept aid. Then she said, 'Only God knows what it means to feel that some one wants to share my burden, and to sympathize, that some one wants to hear about my troubles.' "

"A widow wrote to me one Christmas, saying, 'I don't know how to thank you enough. If it wasn't for the allowance we wouldn't all be together this Christmas. It's hard enough, God knows, to have a vacant chair, but what would it be if we were all scattered?' "

One of the Investigators makes the following statement in her report:

"In looking over the list of families in which the allowance had ceased during the past twenty-two months through there being no longer more than one child under sixteen years of age, I was struck with the fact that of the thirty-four families who formed this list, thirty-two were ready to carry on as self-respecting and self-supporting members of the community."

Names of Investigators and Their Districts

The Commission has seventeen Investigators distributed throughout the Province. The territories assigned to them are as follows:

1.	Toronto	Miss E. W. Rogers Mrs. A. Fraser Mrs. N. A. O'Connor
2.	Hamilton, Wentworth, Halton	Miss E. Storms
3.	Ottawa	Miss M. F. Bennetts
4.	Huron, Middlesex, Oxford, London, Woodstock, Ingersoll	Mrs. R. M. Graham
5.	Essex, Kent, Chatham, Lambton, Elgin, Windsor, Sarnia, St. Thomas, Walkerville	Miss H. Bapty
6.	Brant, Norfolk, Haldimand, Lincoln, Welland City, Niagara Falls, Welland County, St. Catharines, Brantford	Miss C. L. Steward
7.	Waterloo, Perth, Bruce, Wellington, Galt, Kitchener, Stratford, St. Mary's, Guelph	Miss A. Hindley
8.	Dufferin, Simcoe, Grey, Owen Sound	Miss A. Lawrence
9.	Victoria, Haliburton, Muskoka, Parry Sound, Nipissing, North Bay and Sturgeon Falls	Mr. A. G. Bruce
10.	York, Ontario, Peel, Oshawa	Miss E. H. McMullen
11.	Durham, Northumberland, Peterborough County, Peterborough City, Prince Edward County	Miss J. M. Burry
12.	Trenton, Belleville, Hastings, Lennox and Addington, Frontenac, Leeds, Kingston, Brockville, Gananoque	Miss M. M. Abernethy
13.	Grenville, Dundas, Stormont, Glengarry, Prescott County and Town, Russell	Mrs. B. Genin-Preston
14.	Rainy River, Kenora, Sudbury, Algoma, Manitoulin, Temiskaming, Thunder Bay, Port Arthur, Fort William, Sault Ste. Marie	Miss M. J. D. Kennedy
15.	Lanark, Renfrew, Smith's Falls, Carleton	Mrs. H. C. Brodeur

To His Honour Henry Cockshutt, Esq.,
Lieutenant-Governor of the Province of Ontario.

May It Please Your Honour:

The undersigned has the honour to present to Your Honour the Report of The Commissioner of the Ontario Provincial Police for the year ending 31st October, 1924.

Respectfully submitted,

W. F. Nickle,
Attorney-General.

Attorney-General's Department,
March 30, 1925.

ONTARIO PROVINCIAL POLICE

Annual Report of the Commissioner of the Ontario Provincial Police

---

ONTARIO PROVINCIAL POLICE,
Headquarters, Toronto, December 30, 1924.

THE HONOURABLE THE ATTORNEY-GENERAL,
Parliament Buildings, Toronto, Ontario.

SIR,—I have the honour to submit herewith my annual report for the year ending October 31, 1924.

STRENGTH AND DISTRIBUTION OF THE FORCE ON OCTOBER 31st, 1924.

	Commissioner.	Asst. Commissioner.	Chief Financial Officer	Provincial Inspectors.	Inspectors C.I.B.	District Inspectors.	Sergeants.	Provincial Constables. APPOINTMENTS AND RETIREMENTS

The following are the number of appointments made to, and retirements from the Force, during the year 1923-1924:

Appointments

Provincial Constables, 14; Inspectors O.T.A., 5; Provincial Officers O.T.A., 28. Total, 47.

Retirements

Staff Inspector—1 resigned; Sergeant—1 permitted to resign; Provincial Constables—resigned, 12, dismissed, 3; Inspectors, O.T.A.—superannuated, 1, dismissed, 1; Provincial Officers, O.T.A.—resigned, 4, dismissed, 1, died, 1, struck off strength, 1. Total retirements, 26.

TRANSFERS

In the interests of the force and to bring about an increased efficiency, a number of transfers have been effected, and I have in view in the near future the desirability of the transfer of certain district headquarters to centres where it is considered they will be able to function to greater advantage.

CONDUCT

The conduct and discipline of all ranks has, with very few exceptions, been excellent. Very effective work has been done by individual members of the force, and by the force as a whole, often under the most adverse conditions. I am in receipt of numerous letters of commendation from all parts of the Province, also from police forces outside the province, referring to the good work done by particular members of the force. All ranks have worked with this object in view—"that the primary duty of an efficient police force is the prevention of crime."

NEW POSTS

Owing to the considerable railroad and other construction work that has taken place in the Cochrane district, it was found necessary to establish a new post at Island Falls situated at the end of the steel on the T. & N. O., and where the new power plant for the Hollinger mine is being erected. A new post has also been established at Nipigon on the C.P.R., in the Thunder Bay district. Requests have also been made to have a post established at Silver Centre in the new mining country that has opened up in the district of Temiskaming. This request will have to be given attention in the near future. The greatest difficulty I find on opening up these new posts is, that generally there is practically no accommodation for the officer sent there, and no place to detain prisoners that come into their charge.

GENERAL REMARKS

I am pleased to report that, although there has been a slight increase in some of the more serious crimes, yet, generally speaking, there is a more healthy condition of affairs existing in such matters than for any year since the war. Quick arrest, prompt trial, and the certainty of punishment have no doubt been beneficial in bringing this about. The thorough enforcement of the law

cannot be too strongly stressed as a means of preventing crime. The total number of cases prosecuted under all Acts and Statutes was 7,485, an increase of 489 over 1923. Prosecutions under the Criminal Code and other Dominion and Provincial Statutes (exclusive of the O.T.A.) numbered 3,322. Prosecutions under the Ontario Temperance Act numbered 4,163. A classified return of all prosecutions, convictions, dismissals and withdrawals under their respective headings will be found on Page No. 00. There was a slight increase in the number of persons prosecuted for crimes of the more serious nature over the number of such cases reported for the year 1923: *Murder* increased from 13 in 1923 to 18 in 1924. *Manslaughter* increased from 16 in 1923 to 20 in 1924. *Rape* increased from 5 in 1923 to 11 in 1924. *Theft* increased from 388 in 1923 to 526 in 1924. *Robbery whilst armed and otherwise* increased from 27 in 1923 to 33 in 1924. *Burglary* increased from 35 in 1923 to 47 in 1924. *Shopbreaking* increased from 21 in 1923 to 34 in 1924. *Assault, common,* increased from 294 in 1923 to 377 in 1924. *Assault, indecent,* increased from 26 in 1923 to 50 in 1924. There was a slight increase in some minor offences such as breach of Highway Traffic Act, etc. Convictions for driving automobiles whilst intoxicated increased from 16 in 1923 to 35 in 1924. Convictions under the Inland Revenue Act have decreased from 178 in 1923 to 133 in 1924. This is accounted for by the fact that our officers have left the Prosecution of Offences under this Act more to the Dominion officers, whose duty it is to enforce the Inland Revenue Laws. Convictions for offences *re* offensive weapons decreased from 73 in 1923 to 46 in 1924.

Each part of the province was visited by me during the year, and I found conditions generally very satisfactory, with one exception, i.e., the lack of accommodation for our officers and their prisoners at certain new posts that have been established in Northern Ontario; such accommodation is especially necessary at Island Falls and Nakina.

The transfer of a limited number of constables to form a motor cycle patrol, has more than justified itself. They have proved themselves to be a valuable acquisition in law enforcement to districts where posted. Their services have been used to investigate criminal offences where rapid action was necessary, to curb the illicit transportation of liquor over the highways, to investigate the numerous accidents that occur on the highways caused by motor vehicular traffic, and further, their presence has had a beneficial effect in curbing speeding by the general motor traffic on the Provincial highways. It is contended that, to obtain the full value of the services of these motor cycle officers, the control and supervision of all officers patrolling the highways should be under this department.

At present there are two distinct forces so used, both under Provincial departments, i.e., the officers of this department who have full powers of a peace office, and enforce all laws, and those of the Highways Department who have only the power to enforce the provisions of the Highway Traffic Act. The strategic position of the officers employed on the highways is of such importance in case of emergency that their direction and control should be wholly under this department.

CONVENTIONS

I attended the convention of the Chief Constables' Association of Canada, held at Ottawa, July 10-12, also that of the International Chiefs of Police Association held at Montreal, July 14-17. Many subjects of a useful and instructive nature were read and discussed, and much information of benefit to law enforcement gained thereby.

The Menace of the Revolver was discussed at both conventions, and a resolution passed whereby the executive committee of the Dominion Association were authorized to call a meeting of representatives of Dominion, Provincial and Municipal Police Forces, and the Customs Department, to thoroughly study the subject and suggest to the Minister of Justice any new methods of dealing therewith. Very startling figures were submitted by United States police authorities in reference to the number of murders and suicides committed in that country yearly, in which the revolver figured, but it was generally conceded that before anything like effective control of such weapons could be obtained here, a radical improvement in the regulations governing the sale and disposal of the same in the United States would be necessary. The passing of new, or the amending of the present laws, will never prevent the crook and criminal from obtaining a pistol or revolver, any more than the enacting of other legislation will prevent stealing, but I am firmly of the opinion that heavier penalties should be prescribed in the case of any person found in possession of such weapons without the necessary permit.

INVESTIGATIONS BY DISTRICTS

The investigations carried out by district inspectors and those under them in the various districts, both as to criminal and other matters, have been most creditable, and the placing of the responsibility of investigations of all crimes committed within the districts upon the district inspectors has met with great success, and it is only in the most serious cases that the services of inspectors of the Criminal Investigation Branch have been called in. The number of investigations made, (exclusive of the Criminal Investigation Branch) into matters under all heads was 12,473. These consisted of violations of the Criminal Code and various other Dominion and Provincial laws; requests for assistance in locating missing friends and relatives; enquiries for other police forces in the Dominion, Foreign Consuls, Police Departments and Municipal authorities in Great Britain and Ireland and many European countries.

SMUGGLING AND ROBBING ALIENS

Reports received from Windsor and the border cities indicate that foreigners who have made bargains with smugglers to take them across the river to the American side have been held up and robbed during the journey. The plan followed by the smugglers is to transport a party of aliens from the border cities to some point in the neighbourhood of Sombra or Port Lambton, where they are held up, robbed and turned adrift either on land or in a boat on the river. Owing to one party being able to return to the Canadian side after being robbed, stripped naked and set adrift, and lodge a complaint, our officers were successful in apprehending a part of the gang responsible. They are now awaiting trial. It is suspected that two men (apparently foreigners) whose bodies with skulls fractured were taken out of the St. Clair river in September, had been killed and robbed by smugglers. The two men in question were never identified and no one answering their description was reported missing to the police.

CRIMINAL INVESTIGATION BRANCH

The inspectors of the Criminal Investigation Branch at headquarters, Toronto, have been kept very busy during the year, and many crimes of a serious nature have been investigated by them and creditably cleaned up.

Amongst the important matters investigated by this branch were, issues arising from the Home Bank failure, the Provincial bond deals, and the defalcation of public officials, also many cases of murder, manslaughter, conspiracy, arson, robbery, incest, housebreaking, theft, fraud, and many other crimes of importance.

RACE TRACKS

Inspectors were detailed to attend all race meetings held in the province during the racing season which commenced May 17th and ended October 18th. A number of bookmakers, confidence men and liquor peddlers, were prosecuted and convicted, and other well known offenders were refused admission to the tracks. The Belleville Athletic and Driving Association, Stamford Park, Niagara Falls, were prosecuted under Sections 228 and 235, Criminal Code, and the case dismissed on November 24th, 1923. The Long Branch Racing Association was prosecuted under Section 227, Criminal Code, and convicted, which conviction has been appealed. A group of six confidence men flimflammed one Attilla de Pompie, of Cleveland, out of a sum of $60,000.00 at the Windsor races. Investigation was made, resulting in the arrest of Harry Williamson, Geo. B. Scott, James B. Bray and Ralph L. Mason, and all were charged with conspiracy to defraud. Mason, Williamson and Scott were convicted and sentenced to 5 years, and Bray acquitted. Warrants are held for the arrest of two others in connection with this case.

ONTARIO TEMPERANCE ACT

The enforcement of this Act still continues to be a serious and harassing problem, and is without doubt the most difficult and onerous duty our officers are called upon to perform.

Prosecutions during the year totalled 4,187, which were disposed of as follows: Convictions, 3,442; dismissals, 380; withdrawals, 309; awaiting disposal, 59.

The amount of liquor seized by our officers and confiscated by the courts was: Beer, 4,444 cases; beer, 29,950 gallons; whiskey, etc., 3,665 cases; alcohol, 3,899 gallons. Of the alcohol seized, 2,575 gallons was American alcohol in tins. The value of this confiscated liquor was $106,596.53.

Forty-seven motor vehicles have been seized and confiscated under the Amendment to the Act passed at the last Session of the Legislature.

The percentage of convictions is more than creditable, taking into consideration the difficulties which the officers often have to contend with in prosecutions under this Act. The apparently large number of withdrawals is accounted for by the fact that often two or more persons are charged in connection with the one episode; then when the case comes to trial, one will plead guilty and accept full responsibility, the charge against the other persons being withdrawn. There was also an occasion at Windsor during the past year, where a number of cases had been preferred against alleged violators of the Act, but owing to circumstances over which the officers concerned had no control many of the cases could not be proceeded with, and consequently they were withdrawn.

The strong stand taken by the executive committee of the Retail Druggists' Association, which resulted in an Amendment to the Pharmacy Act, combined with a vigorous enforcement by our officers, has wrought a decided improvement in the situation affecting drug stores. The Amendments to the Act, and that of the Pharmacy Act, have been responsible for closing a number of the mushroom type of drug stores which thrived principally upon their illicit liquor sales.

Unfortunately, in the enforcement of this Act, many difficulties, which are not met with in regard to other laws, arise. In some localities the public sentiment is such that reliable and useful information is given to the officers, and in such cases, usually, good results accrue. In other areas public sentiment is unfavourable to the Act, and the minority, instead of aiding the officers, complain about the unsatisfactory conditions and the general lack of law enforcement. That section of the temperance public who merely find fault and condemn the police, and do not attempt to aid in the enforcement of the Act, are to be compared with a citizen who, on seeing a burglar about to break into a house, immediately goes to the nearest telephone and notifies the police, and upon the capture of said burglar, feels that he has rendered a service to society, and rightly so too, but the next day the same citizen passing down the street sees a load of liquor being taken into a certain house, smiles, passes on, and says, "Oh, well! It's none of my business anyway." The bootlegger is a very wily creature, who adopts many ruses, and our officers need the assistance of all right thinking members of society, who, irrespective of their personal views on this question, are themselves law-abiding, and desire to see the law enforced because it is the law.

It has been suggested that foreigners who are convicted of violating the provisions of this Act should be deported as undesirable citizens, and whilst it must be conceded that a large number of persons of alien nationality are among the class of offenders who persistently break this Act, yet, according to our records, such aliens are in the minority, and are by no means the only offenders who come under this heading. Further, whilst many of those convicted bear names that are not of Anglo-Saxon origin, there are very few of them that would come within the present provisions of the Statutes governing the deportation of aliens. I would therefore recommend (if thought advisable) that representation be made to the Dominion Government that the Immigration Act be amended so that it will apply to offenders of this nature.

AMUSEMENT TAX ACT

Assistance has been rendered the inspectors appointed under this Act to collect the tax in out-of-the-way parts of the Province. An occasional visit from one of our officers usually has the desired effect.

FOREST FIRES ACT

By paying special attention to the enforcement of this Act in the northern district, and instituting proceedings in cases of flagrant violations, our officers have materially assisted in preventing the needless destruction of much valuable forest.

GAME AND FISHERIES ACT

Under the provisions of this Act proceedings have been instituted against offenders whenever circumstances have warranted it, and assistance has been given and complaints investigated whenever requested by the officials appointed to enforce the Act.

INSANE PERSONS

The number of unfortunate persons brought to the courts by our officers, owing to becoming mentally unbalanced, increased 100 per cent. over 1923. Sixty-five such cases received attention and were disposed of as follows: Fifty-

six were committed to mental hospitals, five discharged, and four committed to the custody of relatives. The majority of these cases were reported from the northern districts.

GAMBLING AND HANDBOOKS

Twenty-nine gambling machines of various types were seized by our officers during the year and ordered confiscated by the courts. This apparatus consisted of everything from a crown and anchor cloth to an elaborate contrivance which must originally have cost a great deal of money. All gambling paraphernalia after confiscation is forwarded to this headquarters, where authority is obtained to destroy same. Special attention was paid to complaints *re* gambling by handbook men, and a number of convictions were obtained as a result of prosecutions by our officers.

OFFENCES AGAINST WOMEN AND GIRLS

Investigations and prosecutions have been instituted in 159 cases under this head as follows:

Offence	Prosecutions	Convictions	Dismissed	Withdrawn	Awaiting Trial
Abduction	8	5	1	2	.....
Abortion	5	2	1	.....	2
Carnal Knowledge and Attempts	47	25	8	3	11
Incest	11	10	.....	.....	1
Indecent Assault	50	34	16	.....	.....
Rape and Attempts	14	6	5	.....	3
Procuring	3	3	.....	.....	.....
Seduction	21	11	10	.....	.....
Total	159	96	41	5	17

In carrying out investigations under this heading, our officers have rendered valuable assistance to the inspectors of the Children's Aid and the Soldiers' Aid Commissions, who have been interested in many of the cases. Conditions disclosed in making these investigations have in some cases been appalling.

OFFENSIVE WEAPONS

Under the provisions of Section 118 of the Criminal Code and its Subsections, 46 persons were prosecuted for being in the possession of offensive weapons. In all cases of convictions the weapons were confiscated and forwarded to my office where authority was obtained for their disposal. The rifles and shot guns that were safe and reliable were sold through the King's Printer and the revolvers completely destroyed to prevent them being used again. Amongst the firearms confiscated and forwarded to headquarters by the district inspectors, were two 22-calibre rifles of an inferior grade manufactured in Germany, and which according to the sales mark thereon were sold retail in this Province for $3.75. These rifles, upon examination, were found to be defective in the bolt mechanism and with a complete absence of any safety device. As a result of tests made by my officers, it was ascertained that the rifles could be discharged without pressing the trigger in the usual manner, by either of the following

methods—striking the butt on the floor, or sharply closing the bolt. There is no doubt that these cheap German rifles are an extremely dangerous firearm, even when in the hands of an adult, and more especially so when used by young lads, many of whom purchase them by reason of their cheapness. I would strongly recommend that representation be made to the responsible authorities that the importation of any such weapon to this country should be prohibited.

DEATH FROM VIOLENCE AND UNNATURAL CAUSES

The following number of deaths from violence, and unnatural causes, were reported to and investigated by our officers during the year: Murder, 18; suicide, 51; automobile fatalities, 50; drownings, 132; other causes, i.e., accidental shooting, death from burns, exposure, etc., 107. Total, 358.

DEATHS CAUSED THROUGH THE OPERATION OF MOTOR VEHICLES ON HIGHWAYS

Fifty fatalities attributable in various ways to the use of automobiles on highways were reported to and investigated by our officers during the year. This is an increase of 22 over 1923.

These fatalities occurred mostly in the rural districts, and the greatest contributing factor was, automobiles being struck by trains at level crossings on railways.

Investigations proved that in the majority of cases it was not so much the question of excessive speed that was responsible for the fatalities, but rather, careless and negligent driving, and taking reckless and unreasonable chances.

Prosecutions have a beneficial effect in curbing the reckless driver, when he can be caught, but unfortunately in too many cases the fatality has occurred before the necessary prosecution can take place.

I am of the opinion that a large proportion of fatalities, due to the use of motor vehicles on the highways, are caused more through disregarding the common rules of the road, and neglecting to use ordinary common sense, than through violating any particular Section of the Highway Traffic Act.

DEATHS FROM DROWNING

One hundred and thirty-two deaths from drowning were reported during the year.

The great majority of these fatalities should have been avoidable and were due to such causes as bathers getting beyond their depth, overloading canoes, inexperienced persons using canoes, and others not taking sufficient precautions regarding weather conditions.

Deaths from this cause, coupled with automobile fatalities, are taking an altogether too heavy toll of the lives of the people of this Province every year.

The following is a summary of all prosecutions entered, and the disposal thereof, by the Ontario Provincial Police in all districts, from November 1st, 1923, to October 31st, 1924:

Offence	Prosecutions	Convictions	Dismissals	Withdrawals	Awaiting Disposal
Abandoning Child	2	2			
Abduction	8	5	1	2	
Abortion	4	1	2		1
Abusive Language	14	10	3	1	
Arson	17	9	4		4
Assault, Aggravated	14	11	3		
Assault, Bodily Harm	23	17	5	1	
Assault, Common	372	263	80	26	3
Assault, Indecent	50	34	16		
Assisting Prisoner to Escape	2	2			
Attempted Abortion	1	1			
Attempted Arson	1	1			
Attempted Blackmail	1	1

Grand Total	7,509	6,147	815	419	128

COMPARATIVE STATEMENT

Comparative statement of prosecutions under all Acts and Statutes for the years ending October 31st, 1923, and October 31st, 1924:

	1923	1924
Prosecutions	6,996	7,509
Convictions	5,766	6,147
Dismissals	892	815
Withdrawals	260	419
On remand, awaiting trial, etc.	78	128

DISPOSITION OF CASES PROSECUTED

Convicted, 6,147; dismissed, 815; withdrawn, 419; on remand, etc., awaiting disposition, 128. Total, 7,509.

DISPOSITION OF CASES CONVICTED

Fined, 4,189; committed to gaol or penitentiary as penalty, 872; committed to gaol in default of payment of fine, 338; sentence suspended, 516; committed to mental hospitals, 55; otherwise disposed of, 177. Total, 6,147.

CLASSIFICATION OF AGES OF PERSONS CONVICTED

Age 10-15, 62; age 15-20, 448; age 20-30, 2,037; age 30-40, 1,720; age 40-50, 1,141; age 50-60, 490; over 60, 204; companies, 45. Total, 6,147.

MARITAL STATE OF PERSONS CONVICTED

Married, 3,362; single, 2,705; widows, 11; widowers, 24; companies, 45. Total, 6,147.

NATIONALITY OF PERSONS CONVICTED

Americans, 198; Austrians, 110; Canadians, 3,848; English, 229; Finns, 107; French-Canadians, 346; Indians, 44; Irish, 43; Italians, 246; Jews, 147; Poles, 61; Roumanians, 68; Russians, 364; Scotch, 89; other nationalities, 202; companies, 45. Total, 6,147.

PROCESS RE PERSONS PROSECUTED

Arrested with warrant, 1,870; arrested without warrant, 2,755; summoned, 2,884. Total, 6,147.

NUMBER OF SEARCH WARRANTS EXECUTED

Under Criminal Code, etc., 1,021; under Ontario Temperance Act, 4,072; arrests made for other forces, 289; summons served for other forces, 269.

STOLEN PROPERTY RECOVERED

Property that had been reported through various sources as stolen, was recovered by our officers to the value of $104,755.20.

EXPENDITURE AND REVENUE

The report of the Chief Financial Officer shows that the expenditure of the department for the year 1923-4 under all heads was $663,500.10, an in-

crease of $10,984.27 over 1923. Such increase, however, is more than accounted for by the salaries and disbursements of the increased number of temporary Provincial and Special Officers employed in connection with the enforcement of the O.T.A.

The revenue as derived from the various sources during the year, in connection with the Department was as follows:

Fines under the Ontario Temperance Act	$426,665.80	
Fines other than under the Ontario Temperance Act	35,736.00	
Confiscated Liquor sold to Dispensaries	106,596.53	
Constables' Fees	18,156.62	
Sale of Confiscated Automobiles	5,393.64	
Sundries, Refunds, Rebates, etc	774.68	
		$593,323.27
Value of Liquor confiscated for the year ending October 31st, 1924—		
4,444 cases and 2,950 gallons beer	$14,701.62	
3,665 cases liquor and 3,899 gallons alcohol	65,133.84	
		79,835.46
		$673,158.73

Revenue	$673,158.73
Expenditure	663,500.10

RECOMMENDATIONS

I would recommend that the Highway Traffic Act be amended, making it compulsory that:

"All persons driving motor vehicles should have in their possession a license or permit to drive such motor vehicle, such license or permit to be granted after passing an examination before some competent authority, and that the said license or permit be automatically cancelled upon the conviction of the holder on a charge of reckless or negligent driving.

"That all drivers of motor vehicles be compelled to stop their machine when approaching and before crossing a railroad track at a level crossing, unless such crossing is guarded by a watchman.

"That if deemed practicable, a uniform system of anti-glare headlights be made compulsory, thereby eliminating the present danger on the highways from glaring headlights.

"That all horse-drawn vehicles, either driven or left standing on the highway at night, be compelled to carry or display lights during the same hours as now applies to motor vehicles."

CONCLUSION

Before closing this report I desire to express my appreciation of the assistance rendered during the past year to this force by the Municipal police forces of this Province, the Provincial and other forces outside the Province, the R.C.M.P., the C.P.R. and C.N.R. police forces.

I desire to express my appreciation to all ranks of the force for good work performed by them during the year.

I desire to thank the Deputy Attorney-General and other members of your department for kind assisance rendered at all times.

In conclusion, I wish to thank you for the helpful and sympathetic manner in which you have received any proposals placed before you for increased efficiency in the force and for the betterment of law enforcement in general.

VICTOR A. S. WILLIAMS,
Commissioner, Ontario Provincial Police.
